Wireing of the internal scsi flat wire is: port-drive-port.
(Looks like an "Y")

As example, use lower port for scsi cable, upper port to terminate scsi
bus. Same here ;)

The best way is probably ("probably" because I've never seen or tried
one) a CT60, which you can order from Rodolphe now. Or you can buy my old
Afterburner and Eclipse ;-)

From what I figured out, at the current exchange rate it's about $405,
including shipping to the U.S., but not including memory. A quite
pricey compared to modern PC cards and systems, but for a fully
Falcon-compatible at that many times the speed of the original, it'd
be worth it, I think.

If my memory serves me correctly Sam, MagiC Online went offline in
January 2002. I too thought Ben was doing a wonderful job and often
visited it when it was available. However, as you say... time rolls
on.

But the good news is that there are still many great Atari sites
around to sort-of fill the gap that MagiC Online left including:

www.myatari.net (MyAtari, the online monthly Atari magazine)
www.atari-users.net (A popular and regularly updated news site)
www.atari-source.com (Another great news site)
www.ataritoday.com (Headlines from all the major Atari news sites)
www.atari.org (need I say more?)

to name but a few!

Hey, I'd be happy with a PowerUp-2 even. An accelerator that I reasonably afford, and that allows for more that 14mb of memory, is all I need. 60mhz is great, but geez!, $400 will get you a nice 2.4ghz peecee. Anyhow, I'm trying to come up with the bucks to recace my Falcon anyway, which for me takes precedence over speed increase.....for now.

If you are going from the SCSI controller to an external device (with
2 SCSI plugs on the back) you can plug the cable into either plug and
the terminator into the other. SCSI needs termination at the end of
both an internal chain and an external chain. The second plug on the
external device allows you to either terminate or daisy chain another
device onto the external chain.

Hope this helps

Dave

I took an Atari Mega (since it has the removable keyboard) and put it in a mid tower case. I also mounted an ICD SCSI card inside and have it hooked up to a hard drive and CDrom drive. I'm still trying to figure out how to get a second disk drive to work without having to run the cable from the drive B port on the back of the machine. I was lucky and found a case that I could fit the square motherboard into and just had to make a new backplate to handle the different holes. The only major problem I have with the unit is the chips have a tendancy to come loose (since the case is standing up) and I have to press on them to reseat them.

Hi All

I have managed to use Stik2 without trouble with my Freeserve address but the amount of junk emails is driving me to distraction, so much so that I am trying to migrate to my other ISP accounts, with UKFantastic and FreeOla. All 3 were a breeze to setup on Iconnect. But with Stik2 only Freeserve and UKFantastic connect correctly.

FreeOla fails on PPP connection, can anyone help me on this? Or provide some pointers as to what to look for as I seem to have put the Username and Password correctly into the CFG file.

Unless there are some TCP settings to change I am fairly clueless as to why Iconnect should work OK and yet Stik2 fails on the first hurdle.

Hello all,

I'm the owner of an old (of age) Atari 520 STFM, buyed in Italy in 1990 and
there named "Serie Oro", RAM 1024 KBytes, B&W monitor SM124, mouse, TV
cable, original packings, techn.documents, perfectly working.
As I must get rid of it to make room,
In your opinion, has it still a market value (at least in your countries),
or is better for me to throw it away?
In the first case, what could be an adequate price?

Thanks for kind replays, and greetings to everybody!
(and sorry for my bad English..)

arlo

I simply use 1.44Meg disks with the non copy protect window covered! It seems best to put the cover on the non label side which allows my Win XP PC to read and write to 720K disks (but it cant format them) perfect for transferring small amounts of data. I've also formatted 1.44 disks with an STE to 720K or any non standard Atari format with out that window covered. The window is there to tell 1.44 Meg drives its a 1.44 meg disk.

>The window is there to tell 1.44 Meg drives its a 1.44 meg disk.

Be careful! There have been reports that the data on HD disks
formatted in a DD drive is easily corrupted. This is because HD
disks need a different (slightly higher?) magnetic flux due to a
difference in the coating. As the write head current in a DD-disk
ST is under-strength, the disks may read OK at first but lose some
of the magnetic field over time and become corrupt.

On a related issue, there was a reply that there were no 1MB
disks. Actually that's not true - the capacity of *unformatted* DD
disks is theoretically 1MB, and many disk boxes were marked as
such. I have a couple here: 'Capacity unformatted: 1.0 MB' in
small print on a box of 'Memory MF-2DD' disk box, and much larger
on an M.M.S. box 'MF2DD | DOUBLE SIDED | DOUBLE DENSITY | 135 TPI
1 MEG'.

The standard Atari format 9 sectors 80 tracks cuts this down to
720 kB, though it is possible to format to higher values in excess
of 800 kB safely on most drives - but they can't then be read on a
PC. The difference from 1 MB is that the cluster addressesd take
up space, as do lead-in bytes for each cluster (or is it sector?),
the root directory and the FATs. Other platforms may be able to
get more capacity even with 9 sectors 80 tracks.

Regards, /Peter/

It depends on what you're doing with it. To be honest, there really isn't a large amount of software out there that uses the FPU, but for the few that do, it either makes an incredible speed difference, or gives you program features that wouldn't be as feasible otherwise. A couple programs that I know of that use the FPU are...

Eureka (2D/3D graphics program)
Ghostscript (PDF and Postscript viewer)
Linux (Unix-based OS)

I know there are others, but that's all I can think of off the top of my head. Most of the software is graphics or mathematical calculations program, as far as I know. I know there are some TT programs that will run on a Falcon with a 68881/2, also.

Anyway, I hope this helps!

Nview/Nconvert has a 68881/2 version. I don't believe the latest version
uses the FPU though.

Ive been out of the scene for a while, so thegive the stupid question..

Are there any current clones available on the market, or are there
any companies that still have some stock for the high end machines?

I konw at one point there was a PPC atari clone in the works too.. did
that project die?

My poor old 4mb ST is showing its age, and it would be nice to come
up with something 'newer'.. Even though im normally on a i386/FBSD the
ST is still plugged in.

You can't compare the price of (extremely) low volume Atari
accellerators with the price of (extremely) high volume PC hardware.

If you knew the cost involved, you would realise that the CT60 is
extremely cheap. And - you're either an Atari fanatic or you're not. I
am :-)

Hey dude, take it easy....all I'm saying is, I'm an Atri nut with a family. 2 kids going to college, one getting married.....lots of expense right there. I want to re-case my Falcon, if I do it using a pc tower case, I'll really screw things up, so I'll have to buy one of the rack case desiged for the ST/Falcon. That alone will cost between $250-$350 dollars. Then to upgrade Magic, NVDI, buy Jinee and HDDRiver, that'll be another $200 or so. All I'm saying is the stuff adds up and it takes time to come up with the money for everything. So I have to pick and choose what I am goin to get now.

Why spending so much money for a falcon special case (and not so good !) ???
250-350 $??? pffff !
For 50 $ you get a good medium ATX tower and use a bit your tools for metal
to adapt the ATX tower to receive the F30 mb.
Not difficult...
350 - 50 = 300 $ you may buy a CT60 with that ;-)

Just my opinion...
In 2004 , the TOS machines without accelerators are not nice to use.. Really
too slow !!
Only for playing old good games...but those don't need a 350$ case ....;-)

If you can point me to website that can pretty much walk me throught the process of adapting a pc tower case, including the wiring, and extending out the various ports to the rear of that case, then I'll do it. I simply do not posses the knowledge to do this without lots of help. :|

> you've used, and your experiences in doing it.

A few years back, my Falcon's power supply blew, and instead of buying an extremely overpriced replacement, I decided to get a standard AT PC unit and connecting it to the Falcon's old power supply's plug. In the process, I decided to recase as well, so I didn't have the ugly power supply sitting out in the open.

I didn't like the appearance and the amount of space a full tower had to have, so I tried my hand at doctoring up a mid-tower. With some help from a fellow Atari user in town who had more tools than I do to do this kind of thing, we managed to pop out the rivets holding the back port panel from the PC case, so that the Falcon motherboard could stick out the back. That was the only way to have enough room. We also re-drilled holes in the case's motherboard mount to be able to mount the Falcon motherboard. I connected everything, and all works perfectly now. It looks pretty nice, as long as you don't look at the back, where I just have cables running into the case to connect to the Falcon. My next task, once I get some time to work on it, is to find materials to extend the back out a little and re-mount the original port panel back on (which we also cut holes in to allow access to the ROM port, MIDI ports, and Game ports) and make extension cables to place the Falcon's ports onto the panel. I've got a basic plan in mind, but it's not a high priority right now.

Anyway, this wasn't *too* difficult if you have a little metal-working experience and tools (or friends with these), but otherwise I wouldn't suggest it. It does look nice, thought, and has tons of room for expansions (like CT60, etc.) and drives (internal CD-ROM's, Zip drives, etc.).

I agree totally, unfortunately.. i was also starting to consider the board, but with a family to support and the tax man a-comin... seems it might have to wait.

I take it these boards would run mint+aes? or orginal TOS? It wasnt really clear from the page with the "can be used with" quote...

As you probably know, I used a used Falcon Rack. As you also know,
I've recommended you look at past issues of MyAtari for Lyndon's
excellent recasing article.

What I haven't told you is that I did quite a bit of research prior to
the recasing and came up with this: unless you get a premade kit
(like the Falcon Rack) you will have to do a lot of metal (or other
material) work.

In short, you will have to:
1) get a box big enough for the Falcon's motherboard
2) cut holes in the rear (and left side, unless you reroute those
ports) for the ports
3) get a floppy extender cable and way to mount the floppy
4) get an ATX power supply, make a simple adaptation to make it work
on the Falcon, and create an adapter cable using the existing power
supply cable. You will also need a way to mount the power supply.
5) reroute the keyboard and mouse ports (or buy an adapter from
Lyndon)
6) mount the motherboard by drilling holes in your box that correspond
to the motherboard and installing spacers

Most people use a computer case since this largely solves 1 and parts
of 3 & 4 (you still need cables, but the case has a place to mount
things). However, you need not. I seriously considered using a
sandwich material of walnut plywood with a thin steel plate inside for
RF control. The Falcon would have looked like a highly polished piece
of furniture.

You could make just the top half of the case and keep the Falcon in
its lower half if all you need is more room. This would remove much
of steps 2, 3, 4, and 6. If I recall, one of the recasing kits
actually did just that.

cost,
> time, end user fitting, availability, and anything else you can think of.
>
> A: The Wizztronics rack case (still available, bot w/o psu)

The psu issue is trivial. Rerouting the mouse, joystick, keyboard,
and cartridge ports is really the difficult part of this case.

> B: The Desk Topper case (I think Keychange UK offers it, but it doesn't look
> the same)

The Keychange case will be similar to the Wizztronics, I suspect,
although I haven't seen it myself. Keychange does provide for a
keyboard, although I don't think it's a US keyboard.

> C: The Eiffel(spelling)? Rocket case (seen pics of it, don't think it's

I have no idea what this is.
>
> D: Full tower pc case
>
Lower cost, much greater time than the other options. Must use tools
beyond a screwdriver, but not a particularly difficult job.

In short, you must spend either money or time to do a Falcon recase.

Something you might want to consider is to put your items into a 4 bay
SCSI case. Then you would have just two "boxes".

Actually, lower. There are other issues too.

I recommend using 1.44Mb floppies at 720Kb floppies only as an
emergency measure. Fortunately, there is no need to do so, as Imation
still makes them. They are available at many places, including Viking
Direct (
http://www.viking-direct.co.uk/(t5ntusqiqundrbqgux0utyay)/catalogFamily.aspx?ID=34201
).

Welp payed for mine today :)
Getting mine while they are there,not gonna risk waiting for another
run.. Mine with shipping and Paypal fee was a tad under 334 euros
($428 and change) thats still not bad IMHO as finding upgrades for any
Atari system is getting harder and harder to do (wanting a VME for my
Mega STE but only ones i seen were in Europe and they won't sell/ship
to the states) and its brand spanking new too boot :)

Yes steem is very good for emulation.. but its nice to have real hardware to use once in a while.. (and to show off what things were like to new comers that think they need a P-bla-bla with gigabytes of ram)

Which in my case ended today.. seems my SM124 just died.. though i think i can wire it direct to a mulitsync ibm?

Ill check out the acp.. thanks...

Well, there's http://www.myatari.net/issues/dec2001/casemod.htm ,
although that isn't completely step-by-step. It should also be noted
that the CT60 can be put into the original Falcon case if you are
willing to cut a bit of the top of the case away. Frankly, I'm amazed
by the CT60 (though I haven't tracked down all the problems I've been
having yet). I fully admit that an upgraded Falcon isn't cheap (mine
crossed the $1000 mark recently), but there really isn't much reason
to recase the Falcon unless you are planning an accelerator upgrade,
and this run of the CT60 might be your last chance ever.

Hey Mike,

If you've taken pictures of it, your recased Falcon, think you could email them to me. I'd really like to see what it looks like. I have to make a hard choice. Buy one of the ST/Falcon rack cases (rather expensive), or try what you did (at which I would be horrible cause I have neither the tools nor experience).

Galen,

That was all very well explained, the my brain can successfully process the info!!

Now, I just need to wait for an anwere from Wizztronics.

I really am not up to (nor do I have the knowledge, experience, tools, or even patience) to try and convert a tower case. And it would have to look good and natural too!

I'll try to get the Wizztronics case. I can get a "basic" unit for a good price, which falls in at my affordable range. I'm just waiting to be told what exactly a "basic" unit is/consists of.

But again, thanks for your explanation. It pretty much confirmed what I thought.

Sure does. I have 33mhz in the CT2 and a 16mhz in the stock falcon.

Try going to http://www.froogle.com/ or http://www.ebay.com/ and searching for 68882 or motorola 68882. I found quite a number of them at various prices.

Also, I don't believe Cubase uses the 68882, just the CPU and DSP, unless there's something I've missed. I have a 68882, so I haven't really concerned myself about whether it does or not.

Hi Sam!

S>If you can point me to website that can pretty much walk me throught
S>the process of adapting a pc tower case, including the wiring, and
S>extending out the various ports to the rear of that case, then I'll do
S>it.

It's quite straightforward. I've done it with one of my Falcons years ago, but without using port extenders for any of the ports on the rear side of the Falcon, but only for the Midi- and Joystick ports from the left side.

I was able to locate a standard big tower case with the power supply located at the top, so that the large Falcon motherboard would just fit below, and the topmost 4 5.25" bays remained useable. With a midi tower, it's quite likely you would have to re-locate the PSU, and this will also apply for big tower case with the PSU "half-height" on the rear (sometimes with an auxiliary 3.5" bay above the PSU).

I then took the thin metal shielding from the rear side of the Falcon and used it to drill the holes for all of the connectors in the rear side of the tower case.

You will have to remove the part of the rear wall of the case normally holding the PC's extension cards, and replace it with some sheet metal.

The mainboard is sitting there with the left side pointing to the bottom of the case, and as much as possible space between the board and the bottom of the case in order to allow access to the connectors there.

Then, I put the motherboard in, fixing it with the connector bolts and some additional bolts elsewhere. Make sure you don't bend the board or otherwise apply mechanical force, as this might lead to damage!

The Midi-ports (if needed) can be connected directly, with the midi wires just going through some hole in the rear side of the case.

A ROM-port dongle may be fitted inside the case, if it's not necessary to change it regularly.

The joystick ports need some extensions, you may just buy some 15-pin VGA extension cord in order to achieve this, or the appropriate SUB-D connectors and some wire and solder them together.

Two IDE drives will fit internally, and may be connected with a standard 2.5"-to-3.5" adapter cable.

To connect SCSI drives internally, I acquired a SCSI2-to-50-pin-Centronics cable, and installed a 50-pin centronics plug at the rear of the case, with

flatband cable running from there to the internal drives and back to another 50-pin centronics plug on the rear for external devices. This second plug is optional and needed only if you want to be able to connect external SCSI devices.

The adapter cable plugs into the Falcon's SCSI port and one of the centronics connectors, looping the SCSI back into the case. If the second centronics connector is there, the termination plug should go there, otherwise the last device on the internal chain must have it's termination activated. The other side of the SCSI chain is terminated by the Falcon itself.

The reset switch got it's own hole in the rear of the tower, but is quite unreachable there. So i located the solder joints it normally shortens, and soldered some wires to the tower's reset switch there.

As for the PSU, mine was an old AT style one, no ATX. So, the connection was quite simple also. Just connect the corresponing voltages (GND, 5V and 12V), but make sure you don't mix them up!).

All of the above information written from memory, so no guarantee whatsoever.

And always keep in mind you're handling sensitive electronics, so take the usual precautions against static discharge!

With best regards
Ekkehard

Hey folks,

Well it's been quiet from my side of the ocean for a little while now I thought I'd share what's going on.

Firstly, samba has been ported to mint, though it still has some issues. The rpms are available at http://ns.racingchannel.com/samba/ although I would probably wait until they get into the sparemint server. There is some issues causing the client end to complain with a message like "Server out of memory", the only way to fix this is to restart smbd. I haven't tracked this problem down yet.

Last night I created the first successful gtk+-2.2.4 port and ran the tests remotely. We have some problems with the Atari X server that need worked out with fonts, but a Pango bug has been holding us up for what seems like forever and a day.

Compiling (and almost finished) is the most recent version of gaim. This means msn, yahoo, etc all those plugins will work on gaim for the atari once I get done. This also sets up the stage for a native aes/vdi gtk port since gtk+-2.x is much better designed for that and our changes should be more portable to newer releases of gtk should we deem such a thing necessary.

I am now running on an E141J mask 060 at 92.5MHz with a perfectly working FPU (stupid rev 1 chip was BAD!) and I expect to go higher once I can cool this thing below 50C. My bus speed is also 25MHz and my compiling is going MUCH FASTER! It's like being in heaven compared to 50MHz 060 and SDRAM speed ;-)

So yeah, I've been slacking a bit with gim, and I expect to pick up the pace on it now that I have a useable system again. But I first wanted to show off to myself how much horsepower I have by managing to compile samba, gtk and gaim in less than 12 hours time :)

Thanks,
Mark

>Porthos is the best one Carey.... Works great....

Porthos is great and fast but not all pdf's can be viewed without
problems, shareware. If it's still maintained I don't know.

Ghostscript (gemgs) is very slow but at least it displays (allmost) every
pdf without problem. Also with gemgs one can view *.ps and *.eps which
AFAIK is imposible with Porthos. Freeware

Hi all,

after more than 12 years in a box, I decided to give a second life to my old Atari 1040 ST...when I discovered that half of my disks haven't survived the "time travel". So I'm looking to buy (again) some original games from that time (+-1990). Would anyone have any idea where I could find some (I'm located in Belgium, if that could be of any use)?

Thank you very much for your help.

St&#65533;phane Smirnow

Our dishwasher just expired, which I can live without, however, it expired in such a way that it's demolished the flooring and one kitchen cabinet (the base rusted out, making it leak in many and varied ways :/), which I can't.

So, if anyone is interested before I put it on eBay:

Extremely tidy Falcon030, 4Mb, no HD (depending on whether it has been sent, I may have a bracket for fitting an HD to it), 68882 FPU, box, manuals, and uncased SCSI HD with MultiTOS setup (I need the housing I've been using, as it's part of my Acorn collection).

ï¿½250. It should reach that on eBay, but if you feel that's too much you can always take a chance and let me list it :)

No yellowing. Mouse is unmarked.

Will deliver in person in SE Scotland/NE England, or postage at cost (around ï¿½15 in the UK I expect), will ship overseas for the right price. Can take PayPal or cheque/cash, latter preferred due to the need to buy new cabinets.

And yes, the Falcon goes because I'm sworn to keeping my really rare Acorns, which are worth more, and my other old computers are worth less :/

Hi,

Well, I'm in the USA, but would be happy to "restore" any of
your games that I own, and that still work. I have not powered
on my ST in a couple years, but will soon, if I can get a
working HD system from the pieces I have.

If you make a list of what games no longer work, maybe others
and myself can help you...

John

Hi Sam!

S>I'm curious, what would be the best vertical size for case.

Well, depends on which kind of case you would like to use. In case of a desktopper style case, which simply replaces the upper part of the falcon case, it's as wide and deep as the falcon, and as high as you like.

If you're going to switch to vertical orientation, you'll end up with a setup like mine, which means it must be at least 520mm (20.5") tall. Mine are approx. 620mm (24.5"), which allows for placing the PSU above the mainboard, and at the same time there's enough room for 4x 5.25" devices like CD-ROMs in the topmost 4 bays on the front of the case.

Mine are 185mm (7.3") in width and approx 410mm (16") in depth.

Anyhow, you'd also need a new case for your keyboard, or a new keyboard. Either one from MegaST(e) or TT, or a PC-AT type with appropriate adaptor (e.g. eiffel).

With best regards from Ahornberg (Bavaria, Germany)
Ekkehard

Hi John,

thank you very much for your answer. Actually I seem to have more luck than
you, as I still have my internet AND external drive perfectly working :-)
About the original games I'm looking for (and should I say that I'm prepared
to pay well for them!), here is the very important one I'd like to retrieve
(in importance order):
-Dragonflight (from Thalion, 1990)
-Ring of Medusa (army-control game, but don't know the editor nor the
release year (probably around 1990 also))
-Captive
-Dragon Breath
-Dongeaon Master (of course) and Caos Strikes Back
-Drakken
-Full Metal Planet
If you have any news about those original games (still working of course),
or if you have one yourself (and would like to sell it for a good price),
please contact me!

St&#65533;phane Smirnow

Is it?

I'm fairly sure the PSU is 240v, but Falcon PSUs aren't that hard to
come by seemingly - Best and the like have them as spares, and when you
run a towered Falcon or one with a lot of expansions, it's usually
powered by an AT/X PSU.

The PAL vs. NTSC is surely only an issue on the RF output.

Shipping to the US will probably be around ï¿½40, that's certainly the
general area for Europe. UK shipping is overpriced :/

See, that should be ï¿½350. HDs are about ï¿½20, bracket is ï¿½20 if you don't
have one, and I reckon s/h 14Mb RAM is worth about ï¿½40-50.

Yep. Use an ethernec adapter (http://hardware.atari.org) to connect it
to the ethernet. As for Microsoft networking, you'll need Samba. I'm not
sure if Magicnet or STiK/STiNG support that, but MiNTnet does.

Only the usual advice on connecting using a terminal such as Connect! and
manually entering your details to see if you can start a PPP connection.

> Unless there are some TCP settings to change I am fairly clueless as to
> why Iconnect should work OK and yet Stik2 fails on the first hurdle.

Usually you don't need any scripts at all, so make sure that your StiK2
setup matches what's set in IConf (there, the startup script dialog should
be empty aside from "Done" IIRC.

Why do you want to move away from IConnect and its clients BTW?

Well CT2 offers better performance: Faster TT-RAM, faster ST-RAM acces (200% faster, while AB use 1:4 STram normal speed), bus/videl (bus 25mhz, videl 50mhz) accelerator allows resolutions like 928*720 in 16 and 256 colors, and they are faster as plain falcons 640*480*4bit resolution, ct2 also fix scsi/sdma probs as it should be fixed, speedup DSP as well, IDE too.. Its a lot more balanced and compatible as AB040 and overall offers better performance in all, except raw cpu power.. gem demo, ct60 bench, etc all test favour CT2 with overall score....

True, the CT2 does accelerate the Falcon motherboard, which the
Afterburner itself doesn't. But an Afterburner works fine with
e.g. Nemesis or Phantom, up to 20/40MHz. I've used this myself for a long
time.

> videl 50mhz) accelerator allows resolutions like 928*720 in 16 and 256
> colors, and they are faster as plain falcons 640*480*4bit resolution, ct2
> also fix scsi/sdma probs as it should be fixed, speedup DSP as well, IDE

Really? According to Rodolphe he discovered the *real* DMA-bug long after
the CT2 went out of production ;-) Anyway, the Afterburner doesn't do
anything with the DMA-problems (although the installation instructions
suggests a fix if used together with a Nemesis). On a standard,
unaccelerated Falcon that already has a patched DMA clock there is no need
for further fixes when the Afterburner is installed. And if you use a bus
accelerator, this normally includes a new DMA-fix as well.

> too.. Its a lot more balanced and compatible as AB040 and overall offers

This is true, the CT2 is more compatible with some stuff simply because it
has a 030. The 040 (Afterburner) and 060 (CT60) is a very different
CPU. In real life the Afterburner is compatible with almost all software
though, except for some old demos.

> better performance in all, except raw cpu power.. gem demo, ct60 bench, etc
> all test favour CT2 with overall score....

It depends on what you use it for. For pushing pixels and shuffling data
around on the Falcon-bus a CT2 will be faster. For everything else an
Afterburner will outrun it, especially when running everything at 20/40MHz
as I did when I still used my Falcon.

I'm not saying that the CT2 is no good, for many users it will be a better
choice than the Afterburner. E.g. the increased performance of the Videl
is nice. However, when you've used an Afterburner with graphics card for
several years, the CT2 isn't a very attractive option ;-)

Yes really. Rodolphe didnt say CT2 patch works bad, just its overkill when
he designed it. As for bild in potches, i have 2 machines, which had those
patches built it, proper ones for rev of motherboard, one is rev J and one
is c-lab mkx.. SCSI works like shit on both. If u use bus acceleration,
mkx-es SCSI is useless.... So far only CT2 patch realy do the trick, but on
other hand, its special module, with chips etc on it...

> It depends on what you use it for. For pushing pixels and shuffling data

Well all apart raw cpu power is faster on CT2. Normal GEM, moving windows,
it flies on CT2 compared to plain or AB040. Because of simple fact, CT2
acces STRam at 200% and has fast bus.. shuffling data across bus mean many
things :) most, to be precise :)

>
> I'm not saying that the CT2 is no good, for many users it will be a better

Well im not saying AB040 is no good either, and there is also possibility
to use GFX card with CT2 as well i guess :) They are definately different,
AB040 was all about muscle CPU, CT2 is more about balanced power, speedup
virtualy every aspect of Falcon.

And that only if you don't install a switch to still use the old 68030 if necessary. Of course this is a little bit more difficult that with the fantastic ct60 but it can be done.

I did it a few months ago with falcon and it now runs any software without problems. The elder one with 68030 and videl activated, the clean and newer one with Afterburner and NOVA.

I sometimes even do not know which of my falcons to use because the one with the Afterburner/NOVA is fast in GEM handling etc. The other one with ct60 (but still without graphics card) is faster in CPU power (for encoding MP3 files and ATARI800 of course) but then it is horrible slow in GEM handling and the 640x480 keyhole isn't amazing as well. :-)

>choice than the Afterburner. E.g. the increased performance of the Videl
>is nice. However, when you've used an Afterburner with graphics card for
>several years, the CT2 isn't a very attractive option ;-)

I absolutely agree. My setup with MiNT/N.AES, Afterburner/NOVA was fast enough for years so I didn't recognize any huge difference to the GHz PCs that float around. For me there wasn't any reason to switch from my Falcon. If you keep in mind that I already bought it in 1994 I saved a lot of money in the meantime because I wasn't forced to buy every two or three years a new computer like those people with PCs did.

Regards,

Frank

Nope, I just can't do it. Fairly certain that I'm going with an AB040 w/32mb ram.

Then in a over the newxt few months, I'll upgrade Magic, NVDI, buy Anondyne's cd driver and burner software. Oh yeah, I almost forgot...I'll begin recasing my Falcon as soon as I find an acceptable tower case.

So considering all this stuff I want to do this year, it'll be the AB040 I go with. Heck, it beats the 16mhz and 14mb ram I'm currently working with eh?!

Exactly ;-) It patches the bug, but doesn't fix it ;-) I managed to patch DMA very well on my Falcon by modifying the Nemesis DMA-patch. So that patch worked properly too.

> patches built it, proper ones for rev of motherboard, one is rev J and one
> is c-lab mkx.. SCSI works like shit on both. If u use bus acceleration,
> mkx-es SCSI is useless.... So far only CT2 patch realy do the trick, but on

This is true, and I discovered this when I installed the MKX internal SCSI-port on my Falcon. The internal SCSI-port is a real hack, things improved dramatically when I removed it and reinstalled the resistor packs.

> Well all apart raw cpu power is faster on CT2. Normal GEM, moving windows,

> acces STRam at 200% and has fast bus.. shuffling data across bus mean many
> things :) most, to be precise :)

Shuffling data across the FALCON-BUS is where CT2 perform significantly better than the Afterburner. However, in real life this "only" means faster output on the Videl (or more pixels per second, which can also mean better resolutions or more colours). Even with "only" the Afterburner you'll notice a significant increase in speed here, in the few months after I got the Afterburner and before I got the Nova graphics card, I ran my Falcon/Videl at 800x600/8 bit faster than the same resolution in 16 colours on the plain Falcon. The faster CPU and caches in fast-RAM helps a lot!

> Well im not saying AB040 is no good either, and there is also possibility
> to use GFX card with CT2 as well i guess :) They are definately different,

Is there a through-port on the CT2? Where do you connect the graphics card?

> AB040 was all about muscle CPU, CT2 is more about balanced power, speedup
> virtualy every aspect of Falcon.

The faster CPU and fast-RAM on the Afterburner results in a overall faster system.

Seems odd that Iconnect should work but not Stik2 as all you have to put
in is the passwords and usernames and the Tel No. I noticed that my
username for the email address has a -001 after it, so I didn't use that
bit for the login on Stik2. This one is used in Newsie.

>> Unless there are some TCP settings to change I am fairly clueless as to
>> why Iconnect should work OK and yet Stik2 fails on the first hurdle.

>
>Why do you want to move away from IConnect and its clients BTW?
I haven't done a script in Stik2, as I was relying on PAP etc. But I may
try it with this one (if I'm desperate). I haven't used Connect before
are there instructions for using it somewhere?

I am tempted to use Iconnect for the UKFantastic and FreeOla accounts but
I am worried that they will get overloaded with junk emails eventually
like this Freeserve account! I use Stik2 with Newsie to use "Get Selected
Emails" option in Newsie to delete off the server the 150 rubbish emails I
get every 2 days!! Emailer wasn't very good for doing this as it didn't
display the header line for them, so I ended up deleting genuine ones!

If there was a POPGEM client for Iconnect then that would suffice? But
actually the Web access with Dan's OVL is far faster than Iconnects which
is welcome.

Thanks

Neil :-)

If you were thinking about using a standard PC case I would suggest looking for an older style "AT" type case instead of the newer "ATX" style case. With the "AT" you can make an adapter and hook up to one of the 12volt drive plugs. With an "ATX" you need to do some fancier wiring, since the ATX type hooks directly up to the Motherboard to start the computer.

Hi,

>> Well im not saying AB040 is no good either, and there is also possibility
>> to use GFX card with CT2 as well i guess :) They are definately different,

> Is there a through-port on the CT2? Where do you connect the graphics
> card?

You can't use a graphic card (Eclipse) with a CT2 because:

1) There isn't through-port on it.
2) The eclipse driver use the MMU to remap the memory and this one isn't
available on the CT2.

I know it because I have tried..

Nevertheless, The CT2 is much better that AB040 because:

- It's more compatible with existing software.
- MagiC works like a charm on it.
- It provides a very usefull bios (disk driver in ROM, etc..)
- You can 'disconnect' the card by software
- The ram transfert is very fast
- The couple Software/Hardware is very very stable again the AB40

In counter part, the AB40 have some good thinks:

- MMU useable
- a Through-port

And I thing that it's important to say that MagiC doesn't work very well on
Afterburner.

>> AB040 was all about muscle CPU, CT2 is more about balanced power, speedup
>> virtualy every aspect of Falcon.

> The faster CPU and fast-RAM on the Afterburner results in a overall faster
> system.

Some softwares are faster on AB40 and some on CT2... Personally, I think
that the speed are very close.

If you want to use a standard PC type case, look for an older style "AT" type of case. The newer "ATX" type power button connects to the motherboard and you need to do some extra wiring to make it work with an Atari. The "AT" just turns the computer on or off. I cased an older MegaST and it works great. Put an internal ICD SCSI adapter in it and have it hooked up to a hard drive and CDrom. I also did something alittle different. Since the SCSI adapter is all internal I brought the last SCSI plug on my cable to the back of the machine and attached it to an external SCSI adapter type plug. Now I can use an external terminator or take it off and add external devices on to the chain.

Well, my poor offer was only because I couldn't afford more, and you
won't ship - I did say you'd get more and better offers if you shipped
;)

Personally, I'm not into modded machines that much - the idea of a
smaller capacity, but 'proper' drive is more appealing to me.

If I didn't have rotten flooring to replace, I wouldn't be trying to
sell my Falcon. FWIW, I've also sold my Apple Mac G4, and I'm trying to
sell my Gullwing Toyota Sera - the temptation to put my Domesday system
online is strong, as they fetch ï¿½700-800 usually, but I'm resisting
that. I got it for far less and have no intention of parting with it.

And more headaches , RIP one ARP Quadra, I still feel guilt about the death in the post of this fantastic machine,the aggro, the compo, the let down buyer, and one less Quadra in the world , it took me weeks and hours of calls, letters, mails to resolve this disaster and for a few hundred pounds it was not worth the trouble. in fact it cost me more in lost "real work" wages to sort out the mess

I don't remember you , all I had was dozens of replys all less than £120
and for that I would keep it as a reminder of my computing life, back under the desk for now!

My CT60 has an average life before crash of less than one minute if I allow TOS to load into the SDRAM. If I hold down <Left-Shift><Control> at boot up to keep TOS in ROM I have a fairly (but not entirely) stable system.

I'm planning on first switching out the SDRAM (I have to go buy another module), and if that doesn't work, to either reclock or replace the 68060.

There's also a small chance my CT60 or my Falcon is somehow damaged, but I'm not yet at the point where I'm willing to give up and send the lot to you for diagnosis and repair. I've been progressing rather slowly due to a very busy work schedule.

The basic case is the box along with mounting brackets for floppy and
HD. You will also need (sold separately):

1) a floppy extension cable
2) An ATX power supply that HAS AN ON/OFF SWITCH!
(Note: get a super quiet one -- you'll be glad you did.)
3) eight small electrical end caps for adapting the Falcon's power
supply cable to the ATX's.
4) an Eiffel keyboard controller from Lyndon
5) a PS/2 keyboard and mouse
(Note: A DEKA 2 can be substituted for 4 & 5, but old style PC
keyboards are not as easy to find as they used to be, and my AT/PS2
adapter keeps coming loose on my Falcon Rack!)

You might also want:

a couple LEDs
some velcro
a 2 IDE device adapter from Wizztronics
an IDE CDRW
a 12" IDE cable
a CT60

Please note that the basic case will maroon your left-side ports, so
if you want to use the analog joypad, MIDI, or cartridge ports you
will need to make/buy those extenders.

Hello Dave.
I have bought a pc desktop case which is about the right
size to fit my tt030 and the extra bits. i can replace atx over for at
version.

regards john

>Multisync II so the video out isn't an issue for me

I'd say that the MegaSTE probably has a very different PSU to the Falcon
one, which looks like a slightly simpler (i.e. more modern) ST unit. My
Falcon doesn't have any obvious 110v conversion points on the PSU and it
states 220-240V on the base, so I'd assume it won't work on 110V.

Step up transformers are available, or you can just plug it into a
cooker or appliance socket (at least in Canada, they're double voltage,
so 220V).

Hi, I'm Ben Smith, proprietor of Bravo Sierra Computers! I'm an Atari Dealer/Reseller who occupies a unique niche in the Atari World! Most Atari Dealers stick to just selling NEW, I also sell Used/2nd Hand Atari Goods! So not only do I sell NEW Atari Goods at a competitive price, I also sell used Atari Goods you may not be able to find anymore at Swap Meets, Thrift Stores or even Auctions Sites! And I sell for less! And unlike those who will remain anonymous! I test Goods before I sell them. So not only can I sell you some Great New stuff! But I can sell you hard to find 2nd Hand Goods, partly because I'm the guy most people come to when they want to give their Ataris a New Home! I'm saving Orphaned Atari's from Oblivion! Goto http://BensCatalogs.Atari.org or Call (503)256-9974! I'm not asking a lot, I'm just trying to make a living and I'd like to earn your Business!

I never used that option, my mail and news downloads were completely
automated with a Scripter script from all my mail accounts :-)

> If there was a POPGEM client for Iconnect then that would suffice? But
> actually the Web access with Dan's OVL is far faster than Iconnects which
> is welcome.

You might take a look at MagxNet instead. It's fairly complex to set up,
but there was a thread in here some time back that had a step by step. If
you ask Vassilis nicely you could have an IConnect gateway to go along with
the GlueStik supplied with it, and then you can freely mix and match :-)

It's faster than the other stacks as well IMHO.

> available on the CT2.

There is a MMU on the CT2, but it's already in use by the CT2 driver software. This also applies to the Afterburner, but as the Afterburner driver is loaded from disk, the author of fVDI har made a PCI-BIOS compatible driver for it. So the Eclipse works with the Afterburner.

Btw. if it's physically possible to connect a graphics card to a CT2, it should be possible to use a Nova card. Or add PCI-BIOS support to the CT2 driver.

> - It's more compatible with existing software.

I guess this depends on what software you used. Compatibility was rarely an issue when I used the Afterburner.

> - MagiC works like a charm on it.

On the Afterburner too! I had lots of problems with MagiC on mine, but this was also the case before I installed the Afterburner. I know lots of people that use MagiC only on their Afterburners and are very happy with it.

> - It provides a very usefull bios (disk driver in ROM, etc..)

Yes, both fancy and useful when setting up stuff, but once set up you don't touch these things anyway.

> - You can 'disconnect' the card by software

This is a very nice feature with the CT2 for those who needs to run old and/or badly implemented software that will only work with standard hardware. Happily for me I'm not one of these ;-)

> - The couple Software/Hardware is very very stable again the AB40

Not sure what you mean here, but my Afterburner was always very stable. When I had hardware-problems they were never tracked down to the Afterburner, but other modifications done to the Falcon by myself.

> And I thing that it's important to say that MagiC doesn't work very well on
> Afterburner.

This is not correct. MagiC doesn't work on many Falcons, Afterburner or
not. If it works on a Falcon before the Afterburner is installed, it will
also work afterwards.

Galen,

So basically, it would be more cost effective to go the PCTower route, correct?
In either case, I would still need to purchase port extender cables. The
largest portion of the cost is in the case itself.

WHAT
A second festival of Atari featuring Jaguar, Lynx and ST, TT and Falcon..
Here you will be able to play all the great Jaguar games, link your Lynx's
and show off those ST's/Falcons. We want to include as many of you as
possible, and this time we have more room, well 1 more actually. There will
be dedicated Jaguar, Atari Computer, and 8 Bit areas
Do you have a pet project on Atari, then come and show it off, do you want
to play games then we plan to have at least 4 video screens available for
Jaguar games not including the tournaments and people showing what their
Jaguars do.
You want to trade/swap some of Jaguar/Lynx or Atari software? Brilliant,
this is going to be the place to do it. 16/32 Systems will obviously provide
some of the retail but if you've got it come along and do it.
Do you run or are you part of an Atari group, then you should be here!
If you are a company or group and what to support us by giving a prize for
one of our Tournaments, let us know!!
When
June 12/13 2004 - Setup and Start for Attendees on the Friday 11th June
Afternoon late into the night
Opening Hours 10am - 6pm for Visitors
ALL DAY AND ALL NIGHT FOR WEEKEND PASS HOLDERS!! (massive game sessions!!)

Where
Medway Manor Hotel, Rochester Kent UK
More details can be found at http://www.uk.jagfest.org.uk/
Discussion web pages can be found at http://bbs.jagfest.org.uk/phpBB2/

You mean for use in an emulator ? I think the program is usually bundled - it is a long time since I downloaded emulators though. I use a program called Makedisk which makes a virtual disk from a real ST floppy. It needs to be the right format - or you need to specify what the format is if ti different to normal.

Format the floppy on 720kb, and you're ready.
Both system can access it.

(I'm almost sure, that on HD diskettes, you have to tape one of the "holes"
in the corner)

Thanks for your answer, but...

No, what I mean is how to get files, mainly texts, from diskettes first used
on an Atari ST, for use on a Windows PC.

Note that the MS Windows gui is broken when it comes to formatting 720
floppies. In Win2000 you simply can't format a 720 floppy unless it is
already formatted! On the other hand I have managed to read 1440 floppies
formatted (on Atari) to 720 without covering the HD hole!

To format 720 floppies in Windows open a DOS window and enter the format
command with proper parameters. Perhaps "format ?" will return available
switches, my memory is short when it comes to MS DOS...

Makedisk can get you halfway there - put an Atari formatted disk in the PC drive and Makedisk can produce a single file that is an exact image of the disk surface. Then you can use an extractor program to produce files from the image file, or load the image file into an emulator like Steem and copy the files by dragging on the emulated ST desktop into a directory on your PC drive which Steem has been set up to use as its own emulated hard disk.

In my experience, high density disks that have had their identifying holes taped over to work like low density disks are unreliable.

They work for a while, but sooner or later they tend to get corrupted, so don't use them for critical files or files you want to keep for a long time. It'll save you lots of trouble if you can track down a source of authentic low density disks, or you could consider upgrading the ST to a high density drive, if you don't mind cutting a hole in the case to accept the drive front panel and doing a bit of soldering.

Tom

Hi Pascal,

>>>As for the question about using Anodyne's software, the answer is that I
>>>tried to run their cd-reader drivers, with NO luck (I have one of those
>>>old Yamaha CD-writers that work very well with -what is it, MetaDos?)
>>
>> I've had the same experience with a Yamaha 8824...
>
>I have such a CDRW and no pb with Anodyne softwares so far.

Hoho... when did you buy that writer? When I bought it it was just released
and unsupported by Anodyne software, in a later version of the CD Writer
suite however support was added...
The point is if you buy an unsupported drive then the chance of it being
supported one day is very slim. I don't need to tell you how long it's ago
that the Anodyne package has seen an update? And the development of the
Soundpool package seems to have stopped all together...

The SoundPool package at first sight doesn't seem to have a problem with
MMC/3 compliant writers, the Anodyne package which is supposedly also MMC/3
compliant however has issues with certain drives, the PLEXTOR PX 4012TS and
TEAC W5125 (the only two remaining SCSI writers) both are *not* recognised
by the Anodyne package, the SoundPool drivers recognise them.... so unless
someone has a crystal ball and knows for sure that Anodyne will release an
update of CD Writer Suite and add support for these writers and a couple of
more....

Don't get the false impression that every MMC/3 compliant writer works under
the SoundPool package, although is has a much higher success rate then the
Anodyne package there are lots of writers which don't work with it either.
As it is right now, buying a new writer is a bit of a gamble...

Pascal, could you contact me privately? I've lost your email address and
need to get in touch with you rather urgently :-/

Cheers from Belgium
Dennis

1760. Re: Networking A C-Lab Falcon

Newsgroup: comp.sys.atari.st
Date: 2004-02-27 13:17:38 UTC
From: Dennis Vermeire <dennis.vermeire@gmx.net>
Message-ID: <1077898756-146571AEicMi@gmx.net>
Source record: 20149

From: sf0218@aol.com (SF0218)
Date: 19 Feb 2004 01:20:57 GMT

Hi Sam,

>Hey Dennis,
>
>What exactly is MMC-3?

It's a protocol for CD-RW writers, call it a standard if you like. The specs are predefined for the programmers.
The goal was to have a common instruction set among writers, which would make life for the programmers a lot easier. But it didn't took very long before some manufacturers "added" custom commands to the MMC/3 protocol resulting in writers which needed additional supporting drivers. PLEXTOR and PHILIPS for example are known for their MMC/3 "improvements"....

Both the SoundPool and Anodyne packages are basically MMC/3 compliant, meaning that if you connect a *real* MMC/3 compliant writer, it'll be recognised and suppported fully by the software. If however you would like to attach a writer that is not MMC/3 compatible or has an extended MMC/3 command set then you've got to make absolutely sure that it is supported by the SoundPool and/or Anodyne package. If it's not supported then you can still use it as a paperweight or doorstop of course...

Don't ask me which writers work and which don't.... I have no clue. From what I've been reading here over the years and my own experience I can only recommend YAMAHA. Their writers, no matter what type seem to be compatible for a 100% with both the SoundPool and Anodyne drivers.
Last week I posted an address here where one can obtain the last remaining Yamaha writers, if you want one.... go for it. Just like with the CT-60, this is probably the very last chance you'll ever get.

Cheers from Belgium
Dennis

>No, what I mean is how to get files, mainly texts, from diskettes first used
>on an Atari ST, for use on a Windows PC.

Hi Philippe!

That rather depends what format the text files are in! If it's
pure ASCII, there should be no problem (once you use makedisk if
your PC won't read the Atari-formatted disks - this depends on how
old the Atari is, or rather what TOS it used; 1.4-on should be PC
compatible. Even then, problems can arise if the disk was
formatted non-standard, with more sectors or tracks, though I
think makedisk can handle that.)

However, if the files are in a proprietary format, there could be
problems. 1st WOrd/1st WOrd Plus for instance used the ASCII
characters 29 and 30 for stretch spaces, and 2-letter escape codes
for text styles. The whole document was prefixed with four lines
of numbers and a ruler, such as
0660002000000001320000040000000000
10
2-#-0
F0110000001
9[...]0110

(some of these characters are unlikely to survive the ISO
conversion of the mailer, I fear).

Anyway, the preamble can be cut off in an editor such as notepad,
and you should be able to use the find and replace function to put
proper spaces in.

A similar thing applies if the text was written by some other
application.

Regards, /Peter/

Somewhere with +12V. There is a capasitor between the expansion port and
PSU, you can connect it to the positive end of it.

I've seen this machine working at the Cheshunt Computer Club, its a nice clean reliable machine.

Prospective buyers could possibly visit it at said club by appointment of course.

Hallo Rodolphe,

RC>Buy an old cheap falcon and a CT60 and you get the most powerfull TOS
RC>machine !

But my Apple PowerBook with macOS 8.6 and MagiCMac 6.2 is a little bit
faster, when I compare the cpu. My TT is "only" my "Debug- and Test-Atari",
and the Mega STE and Mega ST, too.

Where are cheap falcons?

Nice discussion, guys.

By the way, it grows in me the desire of phone calling the guys at
SoundPool, and I am incredibly disappointed for haven't bought CDrecorder
when they answered my first mail.
I'll make one last e-mail attempt and then I'll pick up the phone.

Bye!

Pretty much. What you get via the Falcon Rack is the ability to avoid
metalwork. Most of the rest of the recase job is the same. However,
if you can still get a Falcon Rack for $99, it might be worth it to
you (if you dislike metalwork) since that's only a $50 premium over a
typical PC case.

CPU benchs are bad with a JIT (MagiCMac and Aranym), about DivX files I
obtain the same results on this 2 machines (frames/s) :

Falcon/CT60 68060 105 MHz/MagiC
iMac PPC G3 500 MHz/MagiCMac/MacOS 9.2

I must obtain betters results with a Super Videl.

Because MagiCMac/OSX is slower (no JIT 68K emulation) on new mac
machines, today the faster machine is a latest PC with Aranym :-(

Regards,

Didier.

I've been using Sting with Freeola for years and I now use Mintnet.
There are some some Sting config files on my webpage that might
help with your StiK2 set-up. Alas I haven't used StiK so I can't
help you more than that.

Have you tried both phone numbers ?

It the Atari disk was formatted with TOS 1.4 or Higher, then all
you have to do is to just put it in the PC and the files should
just come up. For users with TOS less than 1.4, there are special
formatting programs that will format a disk with a special sector
that will allow it to be read in a PC.

Porthos is not shareware, it is commercial. It is still being
maintained. I have the newest version and have not run across a
PDF that does not load, but when I run into one, I just send it to
the author and he usually fixes the problem.

Ghostscript is good and have never failed me. It was a pain to
setup, but when that is done, it functions flawlessly. I just wish
I could run it the 24 and 32 bit modes. Good program.

Around here, there arent even expensive ones...

We need to have a community based project to re-create one. Then publish diagrams, schemeatics, and code so that it cant ever ' go away '. (oh, and make it PPC based would be cool)

Easiest option...
Hit the ST ftp sites and find a utility to convert the boot sectors of your ST formatted floppies so they have the little MS_DOS code where it belongs. See, the disk formats are the same, the fat tables are the same. Only difference is that early versions of TOS set a unique disk ID each time you formatted a disk from the desk-top. This way TOS/GEM had the potential to know any time you did a disk swap, and even be told to keep various and seperate caches for each disk you might be using. DOS however, wants to see the words MS_DOS instead of an ID number there. Such a utility simply writes over the ID number MS_DOS, and you're in buissness.

Don't use this utility on origonal factory distribution disks such as games, or your origonal copy of NeoDesk!. It's perfect for back-ups and your data tank disks tho'. All it does is change a few bits so dumb arse DOS-WIN can tell the disk format is indeed compatable.

Also note...some versions of Norton Disk Doctor running on windows can detect and correct this problem. Maybe even other disk-fixing utilities PC side. If you have such an animal on your windows box...use an unimportant back-up disk and try it :)

Another option...
Get a null modem cable or adaptor ($5 tops at Radio Shack)...
With your favorite terminal programs on both machines, Initiate a standard batch dump using your favorite modem protocol (Zmodem, Ybatch, etc...)

Brian

1799. 060 machine? (was: Re: CT60 status)

Hi Rodolphe!

I's good to see the CT60 success really! Congratulations!

BTW: It should not be that terribly problematic to extend the CT60 card to a full ATX board with all the features IMO (like the Phoenix on your homepage). No... I'm not going to do that, of course. ;) But you seem like a guy that just finished the work and has nothing to work on now ;)

But it might be the other way.... the CT60 may look like useless in this effort when considering different BUS architecture, right? Hmm.

BTW: Someone cracked Crusoe... ;)

best regards

STan

Yes, you're right !
It is not difficult to extand CT60 + PCI cards to an ATX card.
And add a PPC CPU on it near the 060 socket...;-)

1804. Motorola launches new Coldfires!!

Newsgroup: comp.sys.atari.st
Date: 2004-03-02 06:48:48 UTC
From: Matthias Alles <alles@rhrk.uni-kl.de>
Message-ID: <c21aog$qo4$1@news.uni-kl.de>
Source record: 20193

This mail was in the Coldfire-Mailinglist some hours ago:

ColdFire Users,

I am pleased to announce two new processor families to the ColdFire
community. Details on each device can be found at the following link.

http://e-www.motorola.com/files/abstract/overview/MCF547XMCF548X.htm?tid=TSPGAD200402ED1

The MCF547x and MCF548x families of ColdFire microprocessors are the
highest performing and most integrated ColdFire standard products to
date, enabling simultaneous control, connectivity and security. The
first to feature the new V4e ColdFire core, these devices meet the
demands of the expanding embedded network-connected control market by
offering high performance and multiple connectivity peripherals to help
enable cost-effective system solutions.

Product Features:

V4e ColdFire core with performance up to 410 Dhrystone 2.1 MIPS @ 266
MHz (MCF547x) and 308 Dhrystone 2.1 MIPS @ 200 MHz (MCF548x)
* MMU, FPU and EMAC
* 32 KB I-Cache, 32 KB D-Cache

High level of integration
* Up to two 10/100 Ethernet controllers
* Optional USB 2.0 high-speed device with integrated PHY
* 32-bit v2.2 PCI interface 33/66 MHz, five external masters
* 32 KB on-chip SRAM
* 16-channel DMA controller
* Four 32-bit timers, two 32-bit slice timers, one watchdog timer
* Four programmable serial controllers: UART, USART, IrDA and modem
capability
* Two CAN 2.0B (MCF548x)
* Optional hardware-accelerated encryption: DES, 3DES, RC4, AES, MD5,
SHA-1, RNG
* 32-bit 133 MHz DDR/SDR-SDRAM controller
* 1.5V core, 2.5V DDR, 3.3V I/O

Regards,
Michael

Hi Olivier,

>Hello i try to register in the forum english off TWORD,
>but with WS i can't send any informations and ADAMAS can't
>connect.Who's because i'm not sure myFALCON can do it.

Registering is possible with with CAB running the original Iconnect
OVL...

If you haven't got this, then get in touch with the Tempus Word projekt
team, they'll no doubt register you...

I recommend PixArt 4.52. It's freeware now but it comes with all the
necessary bells and whistles. The English translation and docs can be
downloaded from the DDP website (see signature).

Note that you can also load standard TIFF and IMG's in Tempus Word.

And that's what I meant by this will likely be huge. We could easily port
emutos to a crusoe machine emulating a 68060 @ 1GHz :)

Yes the features are nice but it is a motorola part !
If it is difficult to order like a 68060....eh eh

The other problem is the avaibility !
It is 3 years now that people speak about 5407e and it is not available !
Only the 5407 was but the e version , eh eh !
In fact the only e version I know is the core you can buy ...but the chip ,
hum...

So, maybe this time a 54e core will really be available as chip and not
simply as a part of silicium IP !

Which version of Papyrus?
With Papyrus 8.2 under N_AES/freeMiNT I don't have any problem.

Papyrus 10 demo seems to have problems to save in rtf. I tried to save the liesmich.pap in rtf. I got an out of memory message and this on a 256 MB machine??? Maybe a demo restriction? I don't know.

Have you tried it under plain TOS?

I was just kidding. I contacted Transmeta once at the very beginning and
they had no interest in other than AI-32 core emulation. Anyway they are
beyond their best times IMHO and so I think it would be waste of time
investing into this. And as there are quite a few notes from Linus who
worked there that they would not publish details about the microcode it
is therefore unusable.

Hi Everybody!!

Anyhow folks, how does one add a pic to the desktop, if one is not using a full blown desktop (Jinee, Thing, etc.)?

I'd really like to add something to the desktop...it's getting a little boring.

You can add a pick to the desktop in single tos mode without using
Jinnee/thing with picdesk.

It's a multi propose utility(resolution expander/ VDI/ fileselector/ ...)
wrote by Didier, you can find it on anyplayer web page.

Regards
Zorro

> It is possible with a key sequence !

I tried that (the key sequence is both shift keys) and ended up with a
system that still wasn't entirely stable.

I also tried turning off TOS in RAM via the CPX. That did no good.

I am getting decent (but not great) stability by holding down
<Ctrl-LShift> at bootup. Besides keeping TOS out of RAM, this also
does something with the MMU. Is it possible my 68060 is not in fact a
68060 full or is somehow defective? I did pay you for the full
version.

Not legally -- copyright lasts a very long time. However, the odds of being prosecuted aren't particularly high, and in many cases it is practically impossible to find a certain piece of software on the open market.

That said, there are plenty of freely released games to enjoy, and as a matter of principle I do not possess any pirated software.

It helps if you have the same program on both machines so that it will
recognise the formatting. not many people have PC versions of Atari word
processors though.

Format a disk to IBM standard then save the file as doc or txt etc and see
which are useable on the PC. It depends what PC programs you have as to
which will work best. The chances are you may have to reformat the document
which may mean going through every line.

There was a word processor for Atari that would load the
most common Atari word processor files, and let you save
them as .rtf (rich text format) files. These can be read
in by word, and maintain the formatting.

eBay is totally screwed up and isn't letting me list anything /despite/
having an actual credit balance with them! Just get stuck in a loop.

So - I'll take ï¿½200 plus shipping (around ï¿½12 in the UK) for my Falcon.
To refresh, it's a mint, boxed 4Mb 0HD with a 330Mb SCSI disc provided
for rehousing, a fitted 68882/33, all in excellent condition with
manuals, mouse. No yellowing, no wear, original Extras and Language
disks, backups of the other system disks and some LAPD disks.

Can take PayPal (no charges, the 3.5% fee covers my time having to deal
with the bank IMO), cheques or cash, will ship worldwide but I am
positive that the PSU is 220-240v only, I can see nothing to suggest
otherwise - if you buy it in the US and plug it in without a suitable
voltage convertor and it fails to work or blows up, don't blame me ;)

I also have a Commodore PET 2001-32N which I was going to list.
Excellent condition and fully operational, unlike most I've seen listed
lately. ï¿½150, will deliver to SE Scotland/NE/NW (Carlisle) England due
to weight. Shipping will be horrid.

Richard

Hallo Sam!

S>I haven't got Jinee yet, so I just want to put a pic on Majic's
S>desktop, it's getting rather boring.

So you're presumably using Magxdesk. That one is able to set a background image on it's own. In my german version, that option may be found under Optionen/Einestellungen, Kategorie: Desktop, Kachel [filename.img]

As for graphics formats: The colour depth of the image should be equal or less than the colour depth available for screen display, and it's colour table should match the system colour table in bitplane resolutions.

Pictures from other origins have got to be converted to .IMG and the appropriate colour depth and colour table first.

With best regards
Ekkehard

It's not too tough. Check out MagiC's documentation. Under preferences
or settings depending on how your magic is translated you will see a
"desktop" dropdown (there are several different windows available).
Select desktop and there is a thing for image. Double click it and a file
selector will come up. Go to C:\gemsys\gemdesk\pat\256\ and select any
one of these images and hit okay. Whala, desktop changed.

try it out. You should be able to find where it's at. If you're not
running in 256 cols, you have to use the lesser color ones in the "16"
folder.

Thanks,
Mark

Yep. I actually like Magxdesk a lot. Back in the day before I had a
powerhouse falcon, I wish I was able to run Magxdesk elsewhere that magic.
It's really fast, and has the right features.

On a stock falcon, absolutely. Jinnee's feature set belongs on an
faster machine. Nothing slower than a TT030.

It is simply possible that the 060 is defectuous...

But the connection on the mb is surely the problem with your stability....

It is connected without solders ?
If yes, there is somethings to check :
- R216, R221 & R222 must be 33 ohms
- is there something added on U63 GAL ? I mean a 74F04/08 chip.

You still can. The are tons of games that can be downloaded for
the ST, but there are some that I would rather buy since you get
the actual paper docs and such.

There are programs that can be loaded on boot-up that will put a
picture on the desktop. I would just get something like Thing or
Jinnee. Such programs do the best job.

Hello Raoul,

What version of Papyrus do you have? I have version 10 and just saved a RTF file with no problems. I used to get bombs when I used version 8. I fixed that by turning off the caches before I booted up the program and then turned them on after it loaded up. This was done on my Hades under Magic.

the o/s is in rom, the system disks are basicly hard drive formatting and partitioning tools and a uk language disk.

Thats what i have for my TT, they are Ibm format HD disks anyway, if your interested ill zip them and send them to you, then you can extract them on a PC. Im assuming you have a HD floppy drive . . . . .

Try the original Wolfenstein on that setup and watch the screen redraw frame
by frame. Runs perfectly well on a real 286 though.

If I could get the software, I would love to. Considering I have 4 Athlons,
I don't think games playing would be high on my priority list, tho. Besides,
the Jag version is pretty good at Wolf3D anyway:-).

Mark

I hate to say this, but...

It's always best to either RTFM or to take a look through all the menu options for whatever program to look for such settings, especially when there's a menu set aside for such things in full view...

As some one else says GEM is in ROM so you only need the Hard Disk
utitilites. Try HDX504 from
http://www.umich.edu/~archive/atari/Diskutils/. However many folks recon its
worth paying for HDDRIVER
which you can get from http://www.seimet.de/atari_english.html

You know, I've been trying to replace some of the icons. I click on one, then go to assign icon, select an icon, and nothing happens. What am I doing wrong? The Magic manual doesn't really tell me much.

Thanks,
Sam F.

I can't list on eBay. Do keep up. It's also not a 25% discount, since
the previous price included shipping. I also have a good reason to sell
right now, and won't be able to get eBay sorted and list the item in the
timespan required.

FWIW, I've had several enquiries, so I suspect that the main reason why
I didn't get any before was because people were waiting for me to list
it.

If you can't post anything worthwhile, may I suggest that you go and
insert your head in a pan of water which has achieved an overall
temperature greater than 100 degrees celsius? As far as I can see your
whole contribution to the group has been to provide a load of pointless
crap, in other words, you're a troll.

My whole contribution to the group was one mail suggesting that you were
asking an unrealistic price for a very low spec machine.

Do a search. Then send emails to Best Electronics, Atari Workshop, and
everyone else listing Falcons, and if you can find any completed
auctions, to those buyers, telling them that they respectively are also
asking unrealistic prices, or paid unrealistic prices.

Therefore, I am selling my Jag setup. Jag, JagCD, 1 controller, 11 total carts, and 3 cds, 1 book (Jaguar Official Gamers Guide). I tested everything tonight....it all works. All games in their original boxes, except those that came with the Jag (Cybermorph) and the JagCD (Blue Lightning and GridVid). The only negative is that both the Jag box and the JagCD box are a bit messed up on one side, other than that, everything is fine.

Just giving all you NAmerican types a headsup before I get around to putting it up on ebay.

Thanks to all,

Actually, that's a $700 machine. The 16Mb isn't fully addressable, but
implies something like a Whizztronics upgrade ($99, IIRC), which is
nice. FYI, the HD is the same size as the SCSI one I'm including with my
Falcon, all Falcons should have an Atari mouse, speakers are worth $10
unless they're Bose Roommates, and a VGA screen (non Atari) is worth $50
including an adapter. Falcons are slightly rarer in the US, and I'm
still fairly sure the PSU is specific.

If you're not going to do anything other than complain about the fact
that you can't afford a Falcon...

yawn

One, you won't see me trying to get ï¿½70ish for my machine, because I,
and no other Falcon owner, would sell one for that - as I'm sure you've
discovered - and two, it's got a hard drive. It might need an external
case and be connected via SCSI, but once again your reading skills fail
you.

You find a Falcon selling for less than ï¿½200 anywhere. You go buy that
one. Until then, stay with the dreamers.

Double-click on the new icon.

As for editing/adding new ones: use a RSC editor.
If you already have a RSC file with the icons for some program, you can
copy it (or a symb link to this file) in c:/gemsys/gemdesk/rsc/

Bye,
/Pascal/

Rual you really are a bit of an idiot aren't you... stop flaming just
cos the guy won't sell you a Falcon for a few pennies just cos you
scream and shout a little...

Why not try holding your breath until he does sell?

Falcons DONT sell for ï¿½70 in UK... get used to the idea.

There are several. Dougquake is the fastest one, 10-15fps on a 060@66Mhz/16Mhz bus.

AmigaQuake, the commercial release gets about 15-17 fps on an '060 Amiga
with AGA so that is petty good as the AmigaQuake was highly optimized. With
a 3D accelerated graphics card that fps is much higher obviously.

I get 20fps under most screens unless it's very complex, then it drops
down to 15.

I have been trying to sell my Falcon for ages but maybe because I want the buyer to see working and collect in the Manchester UK area I have had no luck, one disastrous post of a rare item has made me deal this way,

It is a 16 meg, but someone say this means 14?, it has a coprocessor I think, and a 3.5" 3 gigish drive shoehorned in and the Nemisis accelerator, it ran a business, net, fax etc and like a PC worked for 12 hrs a day, so it is not a "glass case" item, but still a very good tool, this address is false but if you anyone is interested and willing to leave an address here I will get back to you

Source record: 20080

Hello,

Could someone succeed in making B-Net 3.03 work under MagiC-Net ?
Despites what is written in the HYP file, all I can get is an alert box : "The directory X:\XXXXXX\ cannot be read! (TOS -35)" :-(
One can get B-Net 3.03 for MagiC-Net here :
http://users.otenet.gr/~papval/download/magicnet/BNeTs303.zip
What I did :
- MagiC-Net running perfectly, can ping all machines either with their IPs, name or alias ;
- Folder \START containing BNET_S.APP & HOSTS.INF ;
- Folder \XTENSION containing BNET.XFS and BNET_XFS.INF ;
- Falcon's HOSTS.INF points to TT's IP and alias ;
- TT's HOSTS.INF points to Falcon's IP and alias ;
- ROUTE is defined in MAGX_RC.NET.
Do I have to do something else ? Did I forgot something ?

Thank-you,

J.-Luc

I think you're pretty much bang on at ï¿½200 collected /if/ you're
restricting yourself to such a small area, otherwise - depending on what
people want - I think ï¿½250-300 is nearer the mark. I'm no fan of
accelerators unless they're things like the CT2/CT60, Nemesis isn't
worth much to me, and I don't like the 3.5" internal IDE - just because
I like things to be 'as designed', you know?

You've probably got loads of software, too, which is a bonus.

Richard

I really need to upgrade my Falcon therefore I am sell my Jag setup. Jag, JagCD, 1 controller, 11total carts, and 3 cds, and 1 book (Jaguar Official Gamers Guide). I tested everything last night......it all works. All games in their original boxes w/manauls, except those that came with the Jag (Cybermorph) and the JagCD (Blue Lightning and VidGrid). The only negative is that both the Jag box and the JagCD box are a bilt messed up, each on one side. Other than that, everything is fine.

Just giving all those on this side of the Atlantic a heads up before I get around to putting it all up on ebay.

I've been reading this thread with interest, and I'd say that both points of view are right. I paid ï¿½200 for a 4 meg machine (with some extra's, and 68882). I consider this to be a fair price.

On the other hand, some people might strike really lucky, if they hit the right car boot sale, and well done to them. But in the longer run, as the rarity factor increases, the diminishing number of machines will concentrate in the hands of enthusiasts who will be able to dictate the 'market price'. The chances of getting a Falcy from someone for a fiver, from someone who does not know any better, are diminishing by the day.... So if Richard does not get a sale tomorrow, he just has to hang on for the day after, and if Rual doesn't get a move on, the few remaining 'cheap' Falcy's will have been snapped up shortly ;-)

Just the fact that there are 2 or 3 people here who seem to hate Ben, either because of personal matters or just because they are the typical Unenet-phenomenon of people who are so annoyed with bandwith wasted on adverts, that they'll happily write ten posts in reply to express their grief.

Like the neighbour who keeps talking to you at your door for half an hour, explaining why (s)he doesn't have time to come in for a chat for 5 minutes. :)

Maurits.

I think it is mostly the frequency of identical postings, often
several at a time. But needless to say, to express your disapproval
like the anonymous posters has been doing in here is just pathetic.

Even though I personally dislike Bens methods of advertising (a lot!)
I don't support any kind of abusive postings as has been seen in here
from time to time. If it would turn out that this person is a regular
visitor of c.s.a.s I don't think he would have many friends if his
identity would be revealed...

/Joakim

Hmmm. I don't intend to play games on an emulated 286, but I found
Quicken for DOS 8 just flys on the CT60. It's usable, but slow in
regular Falcon mode.

Hi Paolo,

>Hi, Dennis.
>I already visited Atari Workshop a few days ago, and I didn't see the
>DCWriter program in the SoundPool section!

They should have them, it's hardly a year since we've translated the
manual for them. Perhaps it's listed under a different section?

>About SoundPool itself, I emailed them a few months ago, and I received
>replies to that email...

Yes, they are still in business. Don't believe a word from people dreaming
up their dream aloud .But if you want an English version , you'll have to
get it from the English distributor.... If for some reason Atari Workshop
doesn't sell it anymore then get in touch with me via email (the address
is real)

Cheers from Belgium

1913. Software for sale

Newsgroup: comp.sys.atari.st
Date: 2004-03-09 08:26:58 UTC
From: Stephen Moss <sgm23@eng.cam.ac.uk>
Message-ID: <c2jut6$5qj$1@pegasus.csx.cam.ac.uk>
Source record: 20002

Howdy folks, as you can see I have some excess software for sale. All items are original and complete with boxes, manuals and overlays (where applicable) and are all in as new condition unless otherwise stated.
All prices include postage

ST Software: £5.00 each unless stated otherwise

Battle Command:
Airdropped by Stealth Helecoptor you must use your Battletank to compete various missions, extra
weapons become available upon mission completion (weapon depends upon mission).

Frontier (Elite 2):
Do I need to explane?
1 meg required.

M1 Tank Platoon:
Tank commander simulator - mission based, command your 4 tank platoon and various support units
in night, day, summer and winter action against the red forces, youcan also take direct control of 4 positions in any of the units in your platonn.
1 Meg required.

Silent Service 2:
WW2 Submarine simulator, watch out for those Japanese destroyers.
1 Meg required.

Dog Fight:
Flight simulator, complete missions in WW1, WW2, Vietman, Falklands, Sirria, or dogfight any two planes against each other)
1 Meg required.

TV Sports Football:
American Football (no box) - £3

Corporation:
Infiltrait the Corportation in this 1st person game use guns, bombs, electronic lock pick
and other devices to find the corporations evil secrets. (Box scuffed along edges)

Reach for the Skies:
WW2 Flight simulator, fly for Germany or Britian, you will end up

looking around for those 109's

Leisure Suit Larry 2:
Serria adventure

Dragons Lair:
Don Bluth game, not much game play but excellent catroon style
animation, see what the humble ST
can really do (originaly cost £50 - eek)
1 Meg required.

Speed Ball 2:
Beat Em up handball/basket ball cross, similar to Rolarball if you've
seen the film.

Street Fighter:
Beat Em up.

Crown of Creation 3D:
Mission base space shooter.
4Mb Falcon required, 14Mb prefered. £10.00
Note: In flight sounds are routed to the headphone socket only, so its
best to use external speaker only for this game.

3 Pack (Basic, Warp 9 & GDOS-E):
Basic - Metacombo, UK revised edition as supplied with new ST's (no
box)
Warp 9 - screen accellerator V3.72 (no box)
GDOS-E (disk only)

Payment:
========
I will accecpt payments by PayPal, UK residents can also pay by cheque

If your interested in any of these items please E-Mail me by 1st April
2004, thanks,
Stephen Moss

1916. Testing an AV-server

Newsgroup: comp.sys.atari.st
Date: 2004-03-09 18:27:07 UTC
From: vdjole@EUnet.yu
Message-ID: <c2l29q$9pd$1@news.eunet.yu>
Source record: 20005

Hi, all;

Can someone suggest an application/utility or two which implements a fairly large subset of the AV-protocol (client side), and so can be used to test the functioning of an AV-server (not only checking the existence of the server, but actual real-life operation). Applications which use just a couple of AV-protocol functions are plenty, but e.g. which one, if any, uses AV_FILEINFO or AV_COPYFILE (to get information on a file or to copy a file, respectively) ?

Thanx in advance;

Djordje

1917. help - I need supboot (can't find FTP servers)

What have you tried? What software do you have on the TT030? Direct drive mapping will required NFS or SAMBA for the TT030 and possibly the IBOOK (not sure what you are running on it). I think there is a SAMBA client about but I have never tried it. I use FTP to move files between my PC and ST and TT.

Dave

Jinnee desktop or its demo maybe sufficient for that purpose, I'm not quite
as confident about Thing desktop details but I'm sure it has a reasonable
AV_Server, then there's AVSERVER.PRG, cant remember where i got that, may
jog someone's memory.

John,
That will only give IP connectivity. The Atari does not have any kind of
drive mapping software by default. If you take a look at at my page at
http://www.umich.edu/~archive/atari/ there is some info about configuring
STING for use with a router.

Oh, I did not meen that- but the other side: i.e. assuming that I have an
AV-server, like Jinnee or Thing or some other, which application(s) can
be used to test/demonstrate most/all of the diverse functions of the server.

Hi all,

I've got the Snowman demo, and the California Raisins demo from my ST days. Is there anyway to run them on the Falcon?

Thanks,

If they auto load from the floppy the might work as they are oterwise
try putting the Falocn in to ST low screen res and opening from the
floppy. If that fails you will have to try running Backwards 3 which
effectivley simulates an ST on the Falocn although I have never
managed to get Backwards working.

P.S.
The Seahawks let me down, they were my pick to top their division last
season although it nice to se that thay have finally recovered the
loss of Steve Largent and found some form. I'm still wating for the
the Bears could do the same after Walter Peytons retirement.

Seen on DHS webs site : www.dhs.com

Data of Trio released a new version of Doom for Atari recently.

The new version uses SDL 1.2.7beta which features brand new chunky-to-planar
routines (by Mikael Kalms / TBL). This should be good news for all
Doom-playing CT60-owners as the c2p-routs by kalms are really quick and
optimized for 68060.
Download PMDoom v0.30pre3
Visit the page of Data/trio (Patrice Mandin).

I have my doubts that the ACP is vaporware for any reason other than the developers might come to realize that the project is harder than they thought. Since Rodolphe knows all there is to know about that stuff and Atari, he might be able to help them out if they ask if the project makes it that far. Right now I think they need to focus on building a board which I would imagine isn't as hard as programming the FPGA logic - and possibly even worse, making TOS 4.04 or similar run on it ;)

Doom, as in the original Doom? I used to run that on my 486 perfectly,
surely anything more then an '040 is overkill?

The bottleneck is the video, so new c2p routines likely will help that.

I compiled a PASCAL program on my stock A500 under PC-Task (software PC
emulator for the Amiga) because my PC at the time had broken down and the
assignment was due the next day.

It took a little while, but the end result was a working program ;-)

The C2P routine will only be used if you select a 8bit video mode. The
default bit depth on Falcon is 16 bits. Read the README files to know how
to list available video modes and to select one.

Hello,
I look to the program STG2DO which makes it possible to export a file
STG towards UDO. The site of the author does not exist any more. If
somebody had that or the whole of the tools of convertion for UDO, I
will be with the angels.
Thank you by advance.

Florent

Taskbar use a few of these. IIRC (it's been a few months since I worked on
the AV-code) it use these AV-messages:

VA_START, AV_STARTPROG, AV_STARTED, AV_VIEW, AV_OPENWIND and AV_COPYFILE.

Taskbar still only works properly with N.AES and MagiC, ask me for a
current version if you don't have it.

I use the ftp protacol to link my Hades, STe and my wife's PC all
together. I would suggest going that route.

Hello J.-Luc,

I have BNet working fine under Magic-Net on my Hades and under
Sting on my STe. Do both your machines have Magic-Net running? You
know that yo must have BNET running on both machines before things
will work. Email me and we will get it up and running....

Not sure really. Never used Magxdesk. I would get either Thing or
Jinnee as both of those desktops make it easy to adjust or replace
icons.

Vapourware ?
Yes I think too.
Why ?

1- I was contacted in April 2002 to replace Fredi A. to design the board.
I told YES and proposed an architecture with some IO and selected chips to
be on the mainboard !
After 2 weeks they told me that they have selected an other guy (the Wilheim
story and you know that is was BIG vapourware too).
After I received no news from them !
Sure I heart Fredi was coming back partially, but...

2- There is no prototype photo, even not a image of a schematic, even
partially !
There is no features ! No IO descriptions, so no architecture fixed !
When I was designing CT60 I was able to put schematics & architecture
images on my web site !

Sure, they received a coldfire 5307 evalution kit....and what ?? That
prooves nothing !!
Maybe they will nextly show you a 5475 evaluation kit from motorola... eh eh
;-))
Tomorrow I could buy a kit at one Motorola distributors, and what ??
nothing too ! ;-))

I should begin designing a 5475 mb Flex ATX and I'm sure I would finish
before them, eh eh ;-))

This time I have to read all the sheets about 5475 and have a big
brainstorming ...
I need the advice of some developers about the coldfire performances with
68K emulation that is to be done...
If some dev want to help me...
It may be very quick to design a 5475 small board to plug on CT60 and allow
a crew of developers to design the emulation of the TOS and the software
running under TOS. Same for Magic and others OS on atari machines.
It is time to place order for sample at motorola after signing a NDA because
samples are planned for third quarter 2004.
This get enough time to design the board and design the emulation...

Thanks

1966. FA:Falcon 030, UK

Newsgroup: comp.sys.atari.st
Date: 2004-03-12 17:32:38 UTC
From: Richard Kilpatrick <richard@dmc12.demon.co.uk>
Message-ID: <pcHSfhBoHfUAFwOQ@btinternet.com>
Source record: 19955

Since the people who were interested didn't actually end up buying, I've
now had time to sort out eBay (I'm still baffled as to why I couldn't
list anything), and I have listed my Falcon there.

Essentially as new 4Mb, 0HD internal, 330Mb SCSI disk included for
housing in an external box (I don't have a suitable case). Will ship
anywhere with the usual caveats regarding cost etc.

Starting at ï¿½1, no reserve. If someone wants to bid ï¿½70 and that's all a
Falcon is worth, that's what they'll pay ;)

http://cgi.ebay.co.uk/ws/eBayISAPI.dll?ViewItem&item=3084498216

TV isn't included, of course.

Also listed - Commodore PET 2001-32N (again, ï¿½1), and soon to be added,
BBC Master 512 (quite a rare little beast ;)). Also some other stuff,
such as a Motorola 'Textphone' thingy (little mobile phone with a text
keyboard), an unusued, boxed and sealed 16K RAM upgrade for the Apple][
from 1977, and possibly a number of older die-cast cars.

So, put your money where your mouth is. Bid ï¿½70 on it. I dare you. If it
ends at that, you've got it - so what do you have to lose. I'll sell it
to you, if that's where it ends.

It hasn't closed at ï¿½1, so if you want to be a prat, wait until the
auction is over. I'll tell you what; if it finishes below ï¿½200, I will
apologise on the newsgroup for calling you a complete and utter tosser.
Since I just did.

FWIW, I don't know if one of the buyers didn't want it; they went quiet.
I tend to assume anyone who has to think about it, isn't going to buy.

That's not a bad idea at all, but sure why Coldfire? Why not PPC G4 1 GHz or something. The coldfire sounds different enough that it would be almost as challenging making TOS run on this platform as it would on PPC, except that on PPC you must use emutos and freemint for good features (no games/demos likely).

Coldfire sounds good of course, but it sounds like a dead end direction possibly whereas PPC does not. Just a thought.

If atari moved to ppc too we could build FAT binaries that run on both 68k and PPC. My roomate designed cool architecture for this, such as tos binary extension that allowed for storage of icon data and other metadata inside binaries themselves... Even better it required no source code modifications so uncooperative authors don't matter ;-) He was received with at best a lukewarm response. I say screw it, I am trying to set him to work on teradesk. He'll make it nice and make some good important changes to atari platform.

Oh, I don't know. /Apparently/ Falcons aren't worth much.

But in the interests of selling it - it's the ideal machine to put one
of Rodolphe's last batch of CT60s in! Perfect clean slate machine :D

Yes, I agree. PPC is the future of the Atari platform.

I'm waiting to see what this Pegasos port of SpareMint will be...

PPC means rewritting all TOS or an other OS !
This time nobody seems to be ready to do that in a decent delay.
ColdFire is a 68K compatible (not 100%) and needs only a partial emulation
for some addressing modes and some instructions.

Sure, from a C++ point of view, there is no difference between C F & PPC
except that PPC offer more support with existing things...(Linux).
BUT from an ASM point of view, the CF allows to all talentual ASM coders
(there are much of them yet on atari !) to continue to code ASM with a
minimal modification of their knowledges and habitudes... Ask them about
coding ASM on PPC ?! They don't want...

Sure this last way is different...but the PPC way is already taken by
Pegasos project... a second alternative PPC mb is maybe too late !
Pegasos has difficulties to survive...so why should it be different for a
PPC TOS mb ? It may be worse because there are less developers on Atari than
on Amiga... and the PPC on Amiga is here since several years ! This means we
have to pass several years to access to a capacity to develop a PPC mb about
software maturity ?! Too long !

There is no mb project with Coldfire, and it may be possible to find new
directions, especially with people coding yet ASM for embedded applications
that may allow these excellent coders to use their potential...I think
especially about swedish developers that support strongly this time the CT60
with their developements and demos/games.

That's my point of view now because...the most important CPU familly is (or
was) the 68K familly and the successor is the CF !
Using CF means staying in the bigger & most known CPU familly of the
industrial market and learning domain too.

A PPC is very expensive compared to a CF.
Sure not the same power too...

I never wanted a Falcon ever!, I thought them the a backward step for Atari, overpriced, slow and a late comer to the computer world, I just enjoy your ranting, discounts, and contradictions, my £10 STE is all I need from the Atari world

Sounds like the perfect computer for you.

I haven't contradicted myself. I may have, if my Falcon fails to reach
ï¿½200. In which case I'll admit it.

Hello Edward,

Yes, both my machines run MagiC-Net and B-Net. And both my machines run MagiC 6.20 too, which, according to Vassilis, is not B-Net compatible, unless he tries and fixes it :-(

Regards,

J.-Luc

Falcons do. I think that MegaSTE's and TT's did as well. But ST/E/F/FM's and
MegaST's don't.

Wow, I must really have upset you, for all that effort.

No, it won't sell for ï¿½70. I'm very confident of that. Until that auction ends, you're in no place to suggest that I'll have sold the unit for that amount. Just because I start my auction in a fair manner without reserves doesn't mean that my Falcon is worth less than the others. In the unlikely event that it sells for so little, I'll be more than happy to accept that Falcon values aren't what they were, and it's my financial loss.

You have looked, haven't you? It's still got 9 days to go, and it's at ï¿½52.

http://cgi.ebay.co.uk/ws/eBayISAPI.dll?ViewItem&item=3084498216

Oh, and you can laugh at my house all you want, but it's 2,800 sq. ft, 9 bedrooms, built in the 1840s and I don't have a mortgage. It's also doubled in value in 18 months.

FWIW, my timespan was a self-imposed timescale for dealing with it. I can do what I like with it.

What could also be quite important is the pricing... A coldfire board will certanly be cheaper than a PPC one since a PPC is not cheap i think... And... a PPC is much to normal ;) everybody has a PPC ...but who has a coldfire?

Ofcourse it is possible but i don't think CF has build in multiprocessor
support so it will certanly not be very simple task and there will certanly
be a lot of problems with existing applications...

Hi!

Just one question: If the Atari 2600 can have USB (even if it is
only for joysticks), why can't we?

That would truely be a nice benefit for us, and I would really like it!!

Does anyone know if we can use dvd drives to play dvds?

On our Falcons that is.

What have I missed here? 2600 with USB?!

And is there a 2600 clone out now which offers more than one player? My
gripe with the single joystick type is that it's only for one player,
making Pong etc rather pointless.

Richard

Sorry, I should have mentioned it's posted on Atari.Org. It's called
Stelladapter. It's a 2600 to USB adapter for using USB joysticks.

> And is there a 2600 clone out now which offers more than one player? My
> gripe with the single joystick type is that it's only for one player,

All the 2600's I've ever had included two joystick ports. I used to
play head-to-head pong against all of my friends and family way back
when... Is yours different?

You got it reversed. It's an Atari joystick adapter for PCs with USB. So now, a PC/Mac user can use Atari joysticks, paddles, keypads, etc with Windows/MacOS games, MAME and Atari emulators. I plan to get one as I _HATE_ playing arcade-type games with an analog joystick!

Check out their website:
http://www.pixelspast.com/products/

Someone in Australia is working on a USB adapter for the ST. I don't recall the website.

news:<4051f1a0$0$316$636a15ce@news.free.fr>...
> Vapourware ?
> Yes I think too.

I thought that your CT60 was vaporware, too. For a while it even
seemed that the card is incompatible with almost every Falcon
component. Anyway, it's still great to see the CT60 card out there.

> Why ?
>
> 1- I was contacted in April 2002 to replace Fredi A. to design the board.

> After I received no news from them !
> Sure I heart Fredi was coming back partially, but...
>
> 2- There is no prototype photo, even not a image of a schematic, even
> partially !

There is a prototype photo, it was published in the st-computer
magazine and the news was also published on many news sites. You were
still busy with the CT60 when they were discussing what to do after
Fredi left the project. The Wilhelm board was reality, it existed but
it was simply not suitable.

> There is no features ! No IO descriptions, so no architecture fixed !
> When I was designing CT60 I was able to put schematics & architecture
> images on my web site !

But you were also taking pre-orders.

>
> Sure, they received a coldfire 5307 evalution kit....and what ?? That

> Tomorrow I could buy a kit at one Motorola distributors, and what ??
> nothing too ! ;-))

Look at Normans news on the coldfire website.

>
> I should begin designing a 5475 mb Flex ATX and I'm sure I would finish

> before them, eh eh ;-))

Right, and the 68060 accelerator was available so much sooner than the
060 cards for the Amiga computers ;-)
Oh, btw: let's not forget that you were involved in some vaporware
projects, too. It may not be your fault but I wouldn't talk so badly
about other hardware developers.

> It may be very quick to design a 5475 small board to plug on CT60 and allow
> a crew of developers to design the emulation of the TOS and the software
> running under TOS. Same for Magic and others OS on atari machines.

Those dev's should contact Norman Feske, he's already testing MiNT and
the (partial) 68k emulation.
There are not enough developers to support two coldfire projects and
right now the CT-CF is - unlike the ACP - vaporware.

If you feel like you could help the ACP team, simply contact them.
Maybe you could help their hardware designer - he just isn't the type
of guy who likes to publish every development step on the web.

Regards,
Matthias

Hi,

Here's some Atari ST stuff that I'm not using
anymore. Those are my asking prices. I'm open to offers.
Buyer pays shipping. I am also open to trade offers.
E-mail me your list to fmh@netzero.net for
more info.

Last updated 01-14-04

HARDWARE

Atari 520ST Computer System. Unit is upgraded to 1 Meg of RAM.
Unit comes with mouse, power supply, floppy drive, and manuals
all in the original boxes! $50.00

Atari SC1224 Color Monitor. $30.00

Atari SM124 Mono Monitor. $30.00

Atari PC-1 Computer System. This is Atari's first attempt
at the IBM clone market. The IBM clone is in an Atari Mega ST
case with a 5 1/4" 360K floppy drive instead of the standard 3 1/2"
ST drive. It has an 4.77/8.0 mhz CPU with 512K RAM. Has dip
switched Video Adapter for MDA/CGA/EGA graphics. CPU comes with
an Atari IBM keyboard, Atari labeled MS/DOS, Atari labeled
GEM Operating system, and manuals that are photocopied. Serial
Number is #0007 so besides being very rare it's one of the First!
Also included is an Atari PCM124 mono MDA/CGA/EGA monitor in the
box with paperwork. For both computer and monitor
$250.00

Fast Fax by Michtron. This is the original fax hardware/software
for the Atari computers. Works with ST 520 to Falcon. This is a
special Michtron 9600 Send/Receive Fax Modem with software. The
software is very efficient, powerfull, and simple. Send, receive,
view, log, and print, faxes. has drivers for popular printers and the
SLM804/SLM605. Use a spare 520 or 1040 floppy only as a stand alone
fax machine. Comes with special fax modem, diskettes, and manual.
$25.00

Syquest 44 Meg Cartridges. These will be Atari HDX formatted
with no bad sectors. $10.00

Syquest EZ-135 Cartridges. These will be IBM DOS formatted with

with no bad sectors. $10.00

Syquest EZ-230 Cartridges. These will be IBM DOS formatted with
with no bad sectors. $10.00

SC 1224 monitor cover by Classic Covers. This is a brown cover
with the Fuji logo and underneath "Atari SC 1224 Color Monitor".
Perfect to protect your monitor from dust and have it look cool
too. $5.00

AtariSoft IBM Games
** Note ** these games are made for the IBM PC on 5 1/4" floppy
These were made in 1983 when Atari was making games for multiple
computer and video game consoles. All the games bellow are
BRAND NEW and never used! Games are $10.00 each.

Battlezone *sealed*
Centipede *sealed*
Defender *sealed*
Dig Dug *sealed*
Galaxian *sealed*
Gremlins *sealed*
Jungle Hunt *sealed*
Moon Patrol *sealed*
Pacman *sealed*
Robotron 2084 opened
Stargate *sealed*

GAMES

Annex by D. Pritchard. An DOOM Alien shootem up game.
Docs, disk $5.00

Bridge 4.0 by Artworx. A comphrehensive contract bridge-playing
program. Box, docs, disk $5.00

Captain Blood by InfoGrames. An involved space game of exploration.
Box, docs, disks. $5.00

Decimal Dungeon by Unicorn Software. An education program for
5th graders to Junior High. Uses a variety of decimal related math
problems to help you escape the evil dungeon and caves. Color
or mono. Box, docs, disks. $5.00

Magical Math by Atari. The scholastic series math tutor program
starring Bentley Bear. Box, Docs, Disk $5.00

Mickey Mouse The Computer Game by Gremlin. Help Mickey rescue
Merlin's Magic Wand in the enchanted Disney Castle.
Box, docs, disk. $5.00

NightBreed by Ocean. A game based on a Clive Barker book/movie.
Box, docs, disks. $5.00

Planetarium by Atari. The scholastic series observitory in your
own house. One of the better if not best scholastic programs by
Atari. Comes with box, docs, and disk. $5.00

Renegade by Mastertronic. A Star Raiders type space shooter
type game. Manual and disk. $4.00

S.D.I. by Mindscape. Complete with box, docs, and disks. $5.00

Sinbad and the Throne of the Falcon by Cinemaware. Docs and disks $5.00

Spelling Bee by Atari. The scholastic series spelling program
for kids. Comes with box, docs, and disks. $5.00

Their Finest Hour by LucasFilm Games. The Battle of Britain
flight sim. Box, docs, and disks. $10.00

Transartica by Silmarils. A Falcon030 game where you are
the captain of the a Train on the frozen planet. Docs, Disks. $15.00

MISC SOFTWARE

DC Shower by Double Click Software. Replaces the TOS "Show" button
when double clicking on a file from TOS. Many different types of files
can be manipulated like graphics, compressed files, and HEX.
Docs and disk $5.00

Degas by Batteries Included. The classic graphics and drawing
program for the Atari ST platform. Comes with book and disk $5.00

Emailer V2.3 by Application Systems Heidelberg (ASH). This is
the premier E-Mail package for the Atari platform. This is a
German version that can be upgraded to V2.3f which is the latest
for free via ASHï¿½s Web Site and can be in English via the free
RSC files also from ASHï¿½s Web Site.
For more info please goto
http://www.application-systems.de/emailer/index.html
This is new and come complete with 720K floppy, docs, registration
card, and packing envelope. $30.00

Flash by Antic Software. Complete Gem based telecomunications program.
Has VT-100, CIS, Vidtex Graphics capabilities and more.
Box, docs, and disk. $3.00

Grammar Expert by Phil Comeau Software. Grammar Expert provides easy

access to the rules of English grammar. It also provides advice on
effective writing. Docs and disk $5.00

Image CAT by Wiz Works. The complete graphics cataloging system
for all Atari computers. Print a catalog of image files that you
have on your Atari or view the images on your screen. Docs and disk $5.00

PrintMaster Plus by Unison World. The ultimate designing program
for the ST to create banners, cards, posters, calendars and more!
Box, disks, and docs $5.00

ST Control by Trio Engineering. A BASIC like language that
is closer to using normal language to program. Example
"Draw picture with Neochrome" Box and disk $3.00

Stalker 3 by Gribnif Software. A great GEM based telecomunications
package. The most complete telecomunications and terminal program
produced for the Atari. Can be run as a desktop accessory which then
allows background downloading and more. Box, docs, disk $5.00

STraTOS2 CD. This is a CD Magazine covering the Atari line of computers.
It is dated 1997 and is mostly in French but many of the programs are
in English. It covers and contains software for MINT, Linux, Games
including DOOM, Internet and more. It has a program that runs the magazine
and gets you to the software for automatic installation $10.00

Thunder by Batteries Included. Sophisticated writing tools including
spell checker, speed-typing word expander & corrector, and statistics
on your document like the number or words, lines and more.
Manual and disk $5.00

Time Link by Batteries Included. A time management software package.
Keep track of appointments and see them by the day, week, month,
or year. Manual and disk. $5.00

Ultimate Virus Killer by Oregon Research. Protect your ST and repair
progarms that were infected. Manual and disk $5.00

Universal Item Selector III by AD&D Software. Full Utility functions
from your item selector. Besides adding much need funtionality to TOS's
item selector you get to see available RAM, format floppies, print
directories
set file paths, set file attributes and much more. Docs and disk $5.00

WANTED

MagiCMac OSX
NDVI 5.XX full version or upgrade
Atari Jaguar Battlesphere

OTHER Platforms

I also have lists of software for other platforms like IBM DOS or Windows,
OS/2, Mac, BeOS, NeXT, and Amiga. If interested please request a list.

Repost from comp.sys.atari.st.tech:

I'm having a strange problem with the keyboard on my wife's STFM.
I replaced some of the cups that had become damaged and stopped
the Alt key and K and M from working. Everything seemed to be OK
after I reassembled the keyboard, but now I suddenly find that
[Left-Shift][L] is not producing anything at all although
[Left-Shift] anything else works fine, and [Right-Shift][L]
works OK.

Any ideas? Is it likely to be a trace problem? I do have a spare
keyboard I can use, but it would be nice to get the original
working properly!

I wouldn't do that. My Falcon is already over ï¿½70 with 8 days to go.
Just like cars, if my confidence in the values is misplaced, I'll accept
it. Nothing is /that/ important, you know ;)

Apart from anything else, shill bidding is 'illegal', so to speak.

Nice one Steve Thanks!!, what a Bragging SNOB this guy is EH!!

" My house is 2,800 sq. ft, 9
bedrooms, built in the 1840s and I don't have a mortgage. It's also
doubled in value in 18 months."??????????????????

Yeah and I have just traded in my old cabin cruiser for a 43 Ft ?145.000
model so fucking what?

I received an email from Norman Feske about Atari ColdFire project !

It seems it is not vapourware !
The project is not dead and they put some news yesterday on their web site.

Sorry telling it was vapourware...

So, wait & see...

2014. virus question / internal floppy wanted

Newsgroup: comp.sys.atari.st
Date: 2004-03-15 03:14:38 UTC
From: wboblitt@comcast.net
Message-ID: <83ffb5ca.0403141914.2af26d65@posting.google.com>

Is it possible for a virus to spread with the write protect switch open (protected)? I think I have a weird virus spreading onto some of my original disks. I also think my drives and possibly floppy controller chips are all going bad too so it's hard to tell which disks are bad or not, but if it is totally impossible for a virus to spread with the tab in protect mode I'll worry less. Also does anyone know if it is possible to fry a floppy controller by using PC floppy drives? I know about flipping the data cable around already when you use a PC drive but I had also heard that you can fry or partially damage your floppy controller if you don't do some other technical thing as well (forgot what it was, but I know I hadn't done it). If anyone can give me any advice I would appreciate it, thanks. I really hope I didn't fry my Lethal Xcess original disks! Also if anyone has one or two internal double sided floppies that are in good working condition, to sell, let me know I would be interested. -SaTcom2

> arcade-type games with an analog joystick!

Yes but it will be compatabile with any Windows or Mac emulators that
support USB joysticks. It will see the Atari stick as a regular system
joystick. It's being marketed for the 2600 because the Z26 emulator will
support the paddle and driving controllers as well.

I'm confident many emulators in the future including Steem, Nostalgian, and
Hatari for the ST will provide drivers and more support for this great
gadget.

> - R216, R221 & R222 must be 33 ohms
> - is there something added on U63 GAL ? I mean a 74F04/08 chip.
>
You are impressive, Rodolphe! R216, 221, and 222 are missing!
Instead one of the solder points is attached to a 74F04 chip
piggybacked to U63. Measuring at the solder points gives 12, 7.5 and
8 ohms for R216, R221, and R22 respectively.

Now what do I do?

CrimKingson wrote:
> Is it possible for a virus to spread with the write protect switch
> open (protected)?

Theoretically yes, although it depends on the drive. Some drives are physically unable to write when the disk is protected, others just report it to the computer but can still write when told to. I noticed this when I tried to use a HD-drive on an ST with a *cough*Atin*cough* interface. One of the problems I had with the interface was that it ignored the write-protect signal, and I was able to write and even format write-protected disks. So if you also have a drive that doesn't physically block its writing process, a virus could write to it as long as it circumvents the routines that check write-protection.

As for your connection question, I have no idea.. anyone else? :)

Maurits.

Actually there are a couple of different people wourking on USB for
Atari Systems, Guus Assmann is working on one for the 8 bit XL/XE
system and someone else is working on one for the ST. As the second
person has basically copied Guus's circuit they will be virtually
identical, both plugging into the cartridge port.
It is however my opinion that their approch is flawed and having
informed them of the reasons for my opinion they seem confident that
they are correct, time will tell. I happen to be working on a USB
Joystick to Jaguar adaptor, if I can get it to work it will be easy to
convert the hardware to connect to a cartridge port for use with an
Atari computer although someone would need to write the software.
You should note though that due to the fast through put of data from
some USB devices most Atari users will probably be limited to low
speed devices such as Joystick, Printers and possibly Scanners as the
computers just wont be fast enough to read in the data.

With the olds Atari drive, no. The write protect switch physicaly
disconnect the write signal. But as Maurits, newest drives are another
matter.

Yes, i did! More about that below.

> I know about flipping the data cable around already

In a properly designed system, flipping the data cable around should'nt do
any harm as it was designed so. In a cheaply designed system...

>when you
> use a PC drive but I had also heard that you can fry or partially

It is called "termination resistor". IBM did design the system differently
and the termination is different. Sometimes it work, sometimes it does'nt.
You need a multi-meter to find out. Chech for terminatin around 1000 ohms.

Hello,

A friend trying to help me attempted to contact Vernal Elm as a dummy
vendor of 060 (the same chips I ordered to them and payed
and never received !).

Big suprise, because they answered to him and the guy that answered is
Philip, this same guy that was dealing with me at the beginning of my
business with Vernal Elm !
The web site address has changed and there is now a password ! They try to
be more discretious ...
On their web site page there is always the link to my web site
(www.czuba-tech.com) !!
They continue to do bad business with people !?
I don't understand ...how it is possible...

What can we do to get back my money ??

I joined below the exact mail my friend received :

I'm terribly sorry for the delay in our response; I overlooked your message
when responding to inquiries.
Our parts are actually ideal for stocking spare CPUs. We guarantee them
for 30 days, so if any are damaged in shipment or are defective (very rare
-- less than 1%), we can ensure that you have a reliable stock of quality
68060s.

We can actually offer you a significant wholesale discount at quantity 10
(our retail price is $89).

(10) 68060/50 CPUs : $73/each

We have a dealer pricing page available for other quantity breaks at:

http://dealers.vernalelm.com
user: dealers
password: coldfire

We also guarantee our prices to be the lowest in the market, so we'll be
happy to beat a competitive offer by 10%.

Shipping to france is as follows:

US Postal Express (via DHL): $32
(2-3 days usually) (customs brokerage normally not required for postal
shipments)

UPS Expedited International: $57
(2-3 days guaranteed) (includes any custom brokerage fees)

Please don't hesitate to ask if you have any further questions or if you'd like to proceed with the order (we accept paypal, visa, mastercard, discover, and bank wires).

Thanks very much,

Philip
Vernal Elm LLC

If you PAID for it, then it isn't "pirated".

The original poster's licences didn't expire just because
his disks did.

Shooting kneecaps off $500 each
Rupturing Spleen $350
Breaking ribs $150 each (minium order 5)
Baseball bat clubbing $200 per 5 seconds (minium order 15 seconds)
Breaking one arm $300
Both on same visit special offer $450
Breaking Leg $300
Both on same visit special offer $450
Mix "n" match breaking arms and legs any two $450, any three $550, save $50
and have all done for $650
Full Taking out $5000

Goddam it. If I wasn't selling my Falcon, and lived in the US, I'd be on my way to their door (business and private) right now. Assuming the $ means they are US based.

I have the look of someone you don't argue with. And slightly European. No accent, though, so I'd have to be an 'associate of Rodolphe'.

Oh, and when in the US, I usually have a car with a three body capacity trunk. With a plastic sheet in it.[1]

Richard
[1] This is actually to protect the rental's carpets from sand and stuff, or indeed when I had my Cadillac, just to stop the many fluids carried in the back from spilling and ruining the floor. But they're not going to know that. And always wear black and a long coat, which could easily conceal a shotgun. *grin*

2037. HELP: AdSCSI Micro ST for Mega ST

Newsgroup: comp.sys.atari.st
Date: 2004-03-16 02:08:49 UTC
From: Tim <TjLaZer@NOSPAM.Mail.com>
Message-ID: <105codh3sfe2194@corp.supernews.com>
Source record: 19926
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

I have a AdSCSI Micro ST adaptor, DMA cable and Bracket, but do not have the power cable. Does anyone know where I can get one and where the HD will be powered from? Can I use a regular power cable?

Thanks!
Tim

2040. TOPP updated - sources for COPS and Running-2

Newsgroup: comp.sys.atari.st
Date: 2004-03-16 12:51:14 UTC
From: gokmase@bigfoot.com
Message-ID: <366c6d2a.0403160451.10e1dd08@posting.google.com>
Source record: 19929

Hi all,

The time has come for yet another update of The Orphaned Projects
Page:

COPS: This is to the best of our knowledge the very first time that
the sources for a control panel accessory has been made available. As
COPS is the only one presenting CPX:s in a (fully) resizeable GEM
window, we're very pleased to have these sources resqued so that they
can be put to use in the future!

RUNNING-2: Games are not really common on TOPP, hence we're happy to
see another one now! Running-2 was a project to create a 1st person
shoot'em up for Ataris, and seems to have at least reached the alpha
state. (If anyone has a screenshot of this, please contact us!)

Furthermore, the applications aMail (email client) and Platon
(Electronic CAD) have been added to the wishlist on TOPP.

Regards,

Joakim

It is. Plenty of products have been designed, developed and produced and
even advertised but never saw the light of day as a consumer product.

Until it's physically obtainable it is vapour, by definition.

dictionary.com says this:

vaporware - New software that has been announced or marketed but has not
been produced.

What is also intersting is the bottom sentance:

"Products announced far in advance of
any release (which may or may not actually take place). The
term came from Atari users and was later applied by
Infoworld to Microsoft's continuous lying about Microsoft
Windows."

Yay us :)

The best way one would connect an ATX power supply to a falcon is through a sophisticated adapter board known as a "CT60". This adapter board is plug and play and will allow you to hook up the ATX power supply with no wire cutting or anything.

just kidding ;-)

As far as I remember you just have to find the 5v 12v and ground lines on an atx main power connector. on the falcon power connector, black is ground, 5v is red (I THINK) and 12v is blue (I THINK!) Now I could have these backwards so make sure this is correct!

Basically, the way to hook it up is to do some wire hacking. You also have to install a switch on the atx power wire (which would also be handled by a ct60 ;-))

I've found that you can simply slice 1 wire from the ATX power connector for each thing, gnd, +5V or +12V to the 3 or 4 wires from each on the falcon power connector and all works perfectly. Why the falcon has so many parallel connections is beyond me. Seems a bit overkill.

Thanks,
Mark

I am taking him up on this, though I can't verify the address. It looks to be somewhat of an inner city type area so I'll not be driving my BMW and will be bringing some larger friends (several are 6ft+ tall and know Kung Fu ;-), though if I find the guy is black, I'm probably turning around - not to say I am racist but I think it's more likely that I could end up dead or something if it's a ghetto type rapper guy. But with a partner's name like "Ben Bercowitz" sounds Jewish to me which generally can be more easily threatened with physical violence ;-)

I've got maps and the domain records as well as aerial photos, and I'm also going to be talking to local police, registerfly and some others. At very least I'm going to get his website shut down. At most, get Rodolphe's money back. But first it's an effort from my chair before driving up there.

Anyone who wishes to coordinate an effort should do so through me, though I will not mention in a public forum when I plan to drive there. I will likely photograph the building and surrounding areas and formulate a plan based on that and execute in the weeks after. I'd like to keep this as legal as possible so as to not threaten my own life and family but I may take whatever steps are necessary to at least get answers as to why this fraud is happening. i.e. drug habit, etc. It's not often that drug dealers/users are intelligent enough to prey on rare and alternative architectures... most would rather just push fraudulent Powerbook G4 auctions on eBay.

Anyway, I know several people in the military, law enforcement and other domains so unfortunately, Philip has defrauded the wrong individuals.

Tee hee, and I even have a vehicle to drive with Connecticut tags ;-)

One way or another we will at the very least get answers.

Thanks,
Mark

2049. "Baby Blue" phone dialer?

Newsgroup: comp.sys.atari.st
Date: 2004-03-16 23:49:27 UTC

Wow,

I remember this program. It was a nifty thing. I remember since the ST had the yamaha three channel tone gen it happened to be really useful for telephone type stuff xxxx boxes and the like. I don't know if the program I had was called "baby blue" but it did DTMF for sure. I however am sure that if I did have it on a floppy, that floppy has long been discarded. On the bright side, this type of software should take nearly 5 minutes to write ;-)

I've tried going throught the CT Attorney Generals Office to file a complaint. NO response from them at all. Which pisses me off!

To my knowledge, the address is correct. I've also looked up his name(Ben Berkowitz) and number in the internet based phone book (superpages.com and google also) and they come up as the same information as in the domain registration contact information.

I'm about an hours drive from his location, I just haven't had time to do anything.

Mark.. let me know when you plan to go.. I might join you.

I believe the term "switching" used in power supplies is not related to
the input volts but rather the method to produce the output(s).

In this case yes. It is a switched mode PSU. It is a much more advanced
than the ST's:-) Next time I will look for myself rather than take posts
for granted.

Source record: 19862

Hallo Joakim!

JH>Running-2 was a project to create a 1st person shoot'em up for Ataris,
JH>and seems to have at least reached the alpha state.

It's far beyond that. Running 1 (Running Falcon) has been sold commercially for the Falcon, and is fully playable there. Running 2 was intended to run on the Milan, and wasn't finished because the Milan 2 did never appear and therefore the market was too small. It's mainly using the same maps and the same engine as Running Falcon, but with some extensions for the Milan.

IIRC, the main problem with games on the Milan is missing IKBD emulation for the keyboard, so that movement is very clumsy. Running 2 addresses this, and has got means for directly checking the keyboard.

IIRC there are many assembly files, with comments (if any) mostly in german.

I've got Running Falcon (bought it on a German computer fair back in 1998), and enjoyed playing it very much.

With best regards
Ekkehard

This reminds me of a story related in an interview with a well-known
film producer (either James Ivory or Ismail Merchant... I don't recall).
They were owed money from a local distributor in some part of Europe,
and sent two burly actors portraying mafioso-style gangsters to pay his
office a visit. The performance was so effective that the distributor
paid up.

>
I don't know what an AT supply looks like, but...

For an ATX supply, first obtain one that has an on/off switch. (I'm not kidding -- many do not have one.) Note that the Falcon pulls around 60 watts, and anything you connect (CT60, hard drive, etc.) will also use power. I'd suggest a power supply of at least 100 watts and as quiet as your pocketbook will allow.

Connect the green wire to one of the black wires, which bypasses the internal power switch you don't have on a Falcon. Alternatively, see http://www.gideontech.com/guides/psu_powerup/ to see how to wire an internal switch. Connect three red wires to the three power prongs farthest from the keyboard. These are +5V. Connect four black wires to the next four prongs. These are grounds. Finally, connect one YELLOW wire to the prong closest to the keyboard. This is +12V.

If your Falcon has a built in power supply that you no longer need, it is helpful to cut off the cable so you can reuse the eight prong connector instead of soldering. By combining the Falcon cable with a few PC MOLEX cables you can easily build an adapter cable that will allow you to disconnect the power supply should the need require. If you use electrical twist caps, you don't even have to know how to solder. If you do use the Falcon cable, HEAD THIS WARNING! PC POWER CABLES USE BLUE WIRE TO MEAN -12V. THE FALCON NEEDS +12V. That means that you will be connecting the blue Falcon wire to a YELLOW ATX wire.

So in your definition, everything unfinished is vaporware. Which makes
the definition useless.

Thanks Mark and btw......I will be getting a CT60....but it will have to wait till the next (hopefully there will be one) rollout. I just simpy don't have $400 to shell out and.....I do like to sleep in my bed.....as opposed to the couch or car! Acually, I have about half the funds now, but there's no way I can come up with the balance by April 16th.

Oh well, crossing my fingers for the next rollout, and I've got a gut feeling there will be one.....perhaps with usb capability!!

> Hardware drivers. Having so much trouble getting drivers for older cards
> I have has prompted me. Any thoughts? Legal issues? Requests?

Sure there are legal issues if the original company did not release
the drivers as freeware. But I would't really worry about that since
you obviously need the original hardware to use the drivers ;) Plus I
don't that there will be any commercial re-releases of old Atari
hardware drivers.

I really like the idea, maybe I find some old driver disks if you
start your project

>Requests?

I often read that the Falcon Speed driver disk is requested.

3 days ago I get an answer (miracle after 6 months !!) from Philip H. of Vernal Elm.
To get this answer I wrote him again BUT this time after putting an public message on atari.org, what seems to be a certain effect ;-)

You can read that on dhs !
And you read too my answer !

Now Ben, one of the two bosses is reponding me and speak me as a stupid business man I should be !
Here is the copy of what I just sent a few seconds, commenting each ideas of his letter !

I'm a bit nervous when he told me that I did nothing and so it is my fault if I let them think that I had received well the packet !!
I have here a FAX acknowledge paper in November 3rd !! I'm not so stupid to do business !
I think if he continues to say me it's my fault if no answers were done to my emails and fax, I will spread all around the net the copy of the FAX ! Oh sure, the fax machine maye send me an acknoledge and not print the paper... but there are some other strange things in all this story... maybe only some bad coincidences and bad things accumulations : I'm not stupid and can accept simply WE had no chance on this affair...

And let people think what there is to be thought !

---

sales@vernalelm.com wrote:

> not
> attempted to contact usonce since we resent the package.

oh, STOP !
As I sent in my previous email to Philip (you didn't read it !?) I send several emails to you after the OCTOBER 8th !
I sent a ZIP folder will all emails ! Check them please and see that I send email in october & november !
I sent too a fax in November 3rd ! I have here the paper copy and the

receipt acknoledge from your fax !! This means the paper is well arrived at you, no ???
Before telling a such thing, you have to verify my arguments !
They are true ! I'm honnest !
I didn't phone you because I don't find a phone number for that !
The only thing I could do was the fax because I had no news by email way !
And I did it ! Do you want I fax again this fax ???
You speak below about my professional attitude ??
No answer to a customer fax is ??
It si enough to give me doubts ! What I did at this period !
This was near 1 month after the last email from Philip !
Again, I repeat, I received no email from him after the last he sent me telling me that he will send again the packet !
After that NOTHING !
Even no email to inform me that the packet was gone !
So I don't know when it should be gone to me !!
Difficult to search at french post office, ok ??

> 2'nd of all It explicitly says on our site that you will be
> responsible
> for shiping chargesafter ground mail. You never asked for anything
> else..this is your fault and you canlet all your customers know.

OK It's my fault to choose the postal way !
But this not explaining all the story, so far !

> 3'rd of all I highly suggest that you stop what I'm guessing are
> physical threats(people looking for Philip) . This is for two reasons: 1) it
> sounds pathetic andthere is nothing scary about it 2) the Better
> Business Bureau will not look fondly onyour side of the story if you
> are offering physical threats.

What is amazing is that I was thinking about BBB to help me to get news from you !
After I did all what was possible for me to contact you (after a FAX, what could I do, pay a plane to USA ?!), It was suggsted to me to use BBB because their first (and only ?) mission is to help to solve problems !
I just received 3 days ago a letter from them about the status of the affair :
THEY DIDN't success to contact you !!
Professional attitude you told me ?? how is it possible that a company in your country is not able to get an answer from you about me ??? you have a phisical address it seems and so I consider they sent you a paper letter, no ??
2 days before this letter (so many things are happening this times ;-)) a friend sent me an email copy of the answer from Phlip about a 060 request he did to him, just to test is your company is alive or not !
This was a big surprise to read that :

I'm terribly sorry for the delay in our response; I overlooked your message

When responding to inquiries.
Our parts are actually ideal for stocking spare CPUs. We guarantee them for 30 days, so if any are damaged in shipment or are defective (very rare -- less than 1%), we can ensure that you have a reliable stock of quality 68060s.

We can actually offer you a significant wholesale discount at quantity 10

We have a dealer pricing page available for other quantity breaks at:

http://dealers.vernalelm.com

We also guarantee our prices to be the lowest in the market, so we'll be happy to beat a competitive offer by 10%.

Shipping to france is as follows:

US Postal Express (via DHL): $32
(2-3 days usually) (customs brokerage normally not required for postal shipments)

UPS Expedited International: $57
(2-3 days guaranteed) (includes any custom brokerage fees)

Please don't hesitate to ask if you have any further questions or if you'd like to proceed with the order (we accept paypal, visa, mastercard, discover, and bank wires).

Thanks very much,

Philip
Vernal Elm LLC

I was very nervous after that !!
I was thinking they continue business or start again after a 2 months meriod of total black out about my emails and fax ??
HEY GUY, could you take my place and imagine what I can think when, after a good period of business and a good communication from Philip, there is no answers at all and suddently ??!!!
My last action was to put on atari.org a message - oh everybody on atari market already knew my problem with Vernal Elm since november, so it changed nothing, except what I wanted and hope : a reaction from you !
And I did ! What a miracle !
Now I receive several mails from Phlip and you ...that's perfect....and professional ... ;-)
I just don't undestand why I never received them in october and november and later ...
We are not at stone age as I know....so why so many efforts from me to get an answer about this packet ???!

Just a question :
Philip explained in his email to this friend that you can send :

- US Postal Express (via DHL): $32
- (2-3 days usually) (customs brokerage normally not required for postal
- shipments)

How was it done for me (hey, I really can accept that you sent the packet
!!) ?
If DHL, is there not a tracking number ?
You know that I remember that on my previous (good) business with you,
Philip sent me traking number.
Can you give me the exact date the packet was sent ?

> 4'th)On the subject of the Better Business Bureau, there are two sides to
> every storyand I'm sure that they will understand that you have no
> real argument when they see that the mailing difficulty is attributed
your
> overestimation of your country's mail by only providing the standard fee
for ground shipping.

OK, but this not explains why you didn't answer to my emails and fax and why
I was not informed that the second packet was gone !
My last email was : did you send the packet ?? and I never received a answer
! It is like you were subitely all two dead !
The BBB can understand that too in one of the 2 sides ...
It is what I explained in my complain to explain WHY I asked help from them
!
It is more easy to them to contact them than for me...sure, after I tried
severl times !

> 5'th)(and the final point) we offered to send you the cpu's again.

That's a nice and generous offer, but after 6 month you can understand I do
not need more the 060.
It is a long time now that some of my board customers had to find it
themwelves (maybe at you ;-)) and for the others I found some pieces to
other sources ...
Now, what should I do with them ?? Sell them ? No easy to sell them alone...
It is your speciality, not mine...
But if the packet is somewhere, why not ! I paid and you sent them, so...the
business is done and finished and there is no problems.
Finding them is my affair, with your help, at least, for the date of
shipping (I do not know it !!).

> We are also out the same amount of money as the cpu's never came back to
> us.

If the french post get the packet, it is possible (I have no faith in the
French Postal
Service too : they already lost one CT60 in france !) that french post keep
the packet because it was dammaged (no correct address) and did not want to
sent it back to USA because of the cost : I will ask them if they can not
send back a packet...) I assume you address was on it, so I consider first
thge packet should have sent back to you, ok ? But 'not doing correctely
things' is a speciality of the french post ! :-((

> It is not our responsibility to let us know that you got the
> chips (that point is rediculous, please stop and think twice about what
you are saying)

???? again I was not silent !! I sent several emails and one FAX !!
Please read the .eml in the ZIP folder ! You don't know all the story I
wrote to Philip !
Please inform you and give me your opinion AFTER, please.

> I see that Philip was trying to maintain a relationship with his offer,

Yes, we always had good relation Philip and me !
It was an other reason to not understand why he didn't answer to me after
October 8 th !
And because at the same period I heart about some people that have delay
problems with Vernal Elm, I was really thinking that your company had some
big trouble (what I can understand !), my money was burnt, my packet not
gone and Phlip was moved out of the company....that was for me the only
logic explanation to this silence ... !
Be agree that your silence (volontary or not !) is a fault, no ?
Maybe all emails were lost because of a problem on your server...and your
fax machine sent an acknowledge without printing the fax , maybe....why
not...
On my side, if Philip sent me email after october 8th, I can assure you that
I had no problems with my computer and my email provider...
And my fax is working fine too...
the number I used is : (720) 294-4128

Other strange thing for me : I was never informed when you shipped the first
packet !
In fact I was informed that the^packet was sent back to you by customs ...

NOW PLEASE, HAVE A LOOK on this email
It was sent to me the October 4th 2003 :

Rodolphe,
A customer of ours from Sweden contacted me to ask about your order. I
just wanted to make sure you received this message from last week?
Thanks,

Philip
Vernal Elm LLC

> Regards,
>
> Philip

I sent back my address and phone number !
Two things :
- I never was informed by customs about a packet in standby at them !!
- I never received the email from Philip the September 25th !!
Lucky that a swedish guy ask to him and he sent a copy of his original
email.

This demonstrates only two things :
- You wrote some emails that were never sent (it is impossible ok ?)
- There was a technical problem somewhere between you and me, no ?

> but as his 50/50 partner I will
> reccomend to him that on the part of a lack of communication from you
> and your failure to try and get your package from the french Postal
> system

??? I never told that !
To search a such packet I would know when it was sent ...
Give the shipping date...and I will search at the french central post where
all undistributed packet are stocked for 1 year !
It is at Libourn.

> that we assume that you refuse
> the offerfor the cpu's and will now offer nothing as compensation for
> your errors. (there areno tracking numbers for the delivery type you
> got, you should know
> that...after all it was your money)

Can my money I sent you allow you do search at DHL because it seems THEY
transport the packet betwwen USA & France, no ?
Here is a part of a mail from Philip in July 24th, 4 days before I paid :
>> happier to not deal with solder or pin bending, etc. As always, we will
>> guarantee all of the chips to be at 100% performance and accept your
>> returns whenever it is necessary.
>>
>> Total merchandise cost: $1625.00 USD
>>
>> Shipping options:
>>
>> UPS Express (2-3 business days) - $65 -- we will include extremely low
>> customs values
>> OR
>> Postal Express - $30
>

> I take postal because it is not urgent.
>
>>
>> UPS Total: $1690 USD
>
>> Postal Total: $1655 USD
>
> + 73 because I need now 22 full
> = 1728
>
I effectively choosed Postal Express !
And it is by DHL... I think they should confirm that they get the packet !
Up this time you assume that thepacket is lost in france...but it may be
lost in USA too !
After a coming back (second !) if the return address is bad or
destroyed...where should it go ??
So, please check DHL in USA too.

> Now that you understand (though I'm sure you don't want to)

:-)) that's a stupid remark ! I'm not here to faulse the reality !
I just want to know what happened !

> that you are in the wrong I suggest that you stay out of chat groups with
our business
> name as I promise to return the same fire with a much more credible story.
> I truly am sorry that you were never able to acquire the chips,

me too... I lost 1728$ and you lost nothing...

> but
> as you
> can see ifyou had approached this situation with more professional

Did you not received my fax in November 3rd ?
Not professional approach ??
when a company is not respnding to fax & emails and you can't find a phone
numbern what would you do at my place ???
Choose a third party like BBB ...and when this one can't get answer too and
you have news that the company is alive and continue business, what wuould
you think about this business ? Professional and honnest business ? I don't
think you could think that if you were me ! And it what anybody would think
too...
I'm sincere and honnest and all the atari community knows me and nobody will
think that I'm a bad guy using lies to keep the face !

> and timely behavior thismay not have happened. I would still try and find
out
> if there is a package floatingaround in the mail.
> Anyways, make sure to not be cheap and pay for insurance next time.
> Especially on products you take full payments for two years in
> advance. (Now that's bad business ifyou ask me...come to think of it I

> can see why you might need to put some blame on someone else if you got yourself in a position where you were
> late with delivery)

I had no problems with delivery of CT60 : people who ordered it were informed at each step of the development (ask them !) and I begin shipping the board in June 2003 with the 060 I bought to you in the past ...
Up to this time, only 2 guys cancelled their order : one because leaving atari computer world and one because money problems and I get back to them money ! People know that I just design CT60 to help community at the beginning and that I needed the money by advance because I was jobless with money problem and I was un able to pay the CT60 design from my pocket !!
That was a deal their accepted and I thank them... At bebruary 2002 I foound a good job in switzerland and was anable to finish the design...and I finished it only from May to June 2003... no secret about that !
After shipping more than 100 boards... I just decided to order again at you to finish shipping !
At this time my delivrey was late because I didn't received the 060...
Nobody blaimed me about that...some accept to receive CT60 without the 060...and some others accepted to wait up I find other 060 and have money to buy them (my business is so small that loosing 1728 $ was a catastroph for me and my familly : ask my wife if you dont believe that !!!). I ask help to several US and swedish guys to try to contact you...
Time after time I get a bit money and bought some small qty of CPU...
I was lucky because a german guy proposed me 24 CPU with E41J mask at 40 EUR each... at the good moment.
With them, I was abble to deliver more other CT60.
After, only 20 units were not delivered and no customers cancelled their order, they all wait for me and my 060...

You can read the first message I get from Vernal Elm after 6 months
on DHS.
My answer too.

On atari.org there is the new message I received from Ben of Vernal Elm.
You can read too my answer I wrote today...

Now I wait for soe reponses about some clear questions...

It is possible all this story is a stupid communication problem ...

For his time, I ask to stop all and do nothing against Vernal Elm...

I just hope that we will find an arrangement...

Thank you

Hi!

Have a look: acp.atari.org
Now there is a logbook about the Hardware-development.

Matthias

Yeah,

I could afford the money if I didn't already have one, but I do so I can't
justify it in my head. My money is better spent on the next clone, or the
PCI/AGP interface for the CT60 - and of course to pray I never fry my own
CT60.

Thanks,
Mark

This message is rediculous,

The fault is obviously on their end, but instead of attempting to smooth things over all they simply do is insult you (Czuba) as a business man. This game of "name calling" is about as unprofessional as it gets. This is REDICULOUS Vernal elm! Nevermind the fact that I emailed about 6 months ago in regards to my DEFECTIVE 060 FROM YOU and I NEVER RECEIVED a response! I say fuck you! What about it taking people 1-2 months to receive their shipments? Ahem. PROFESSIONAL!? WTF!?

Mark

I doubt you'd be able to get one less that 250W. Seems to be the min spec
for ATX

I've seen them as low as 60W in small versions and I have one that is 160W

Maybe I'm too trusting but there's a lot of people that did in the end
receive their merchandise. I guess we just have to stay tuned and see if
they give Rodolphe a tracking number. Not that the chips help rodolphe
now that he already purchased from another supplier probably, but hey, at
least he gets something. And in the end, could work out good for us,

maybe more CT60's will get produced. More CT60 = more falcons = more high performance atari users to help us get shared libs and VM in MiNT ;-)

> Pretty much speaks for itself...

I just carefully read over the email trail between Philip, Ben, and Rodolphe and I now have reason to believe that they have read the threads on comp.sys.atari.st, so everyone wave hi to Philip and Ben. Hi. *waves*. Rest assured there was never any physical threats against you, but when businesses don't deliver, what do people do? Have you ever read any reviews on Tom's hardware guide? They go to the place, they take photographs of the address, and they attempt to start a dialog with the person spraying what could amount to lies. This is what happened with Michael's Computers and some set-top box on hardOCP. If these huge review sites choose this method I am sure it is a perfectly reasonable process to inform the public about what they might be dealing with.

Now as far as the threats are concerned, I don't know if I ever made any but you don't have to worry about me. I'm not a physical harm kind of guy. I just feel I need to have some guys with me for protection (yes, it's exactly the opposite). No telling what the accused might do when people show up on their doorstep with a video camera. And remember, if anyone intimidates you, it would only be to get back what is rightfully theirs anyway, I don't know a single Atarian that speaks his mind around here that is likely a criminal and hence making open threats to your life(s).

What is more likely to happen is that the IRS, those nice guys that they are, will take a sudden interest in overseas profits that might have been unreported, the local New Haven police are probably very interested judging by what I see, and I'm sure the BBB will have something to say (and I doubt it will be in your defense, considering they aren't important enough for you to respond to them).

Now just to see about whether or not Vernal Elm is a registered business or not, and if they have to be in New Haven. I know in most places they need to be - but hey.. Ever locale is different.

But alas I have done nothing yet, besides collect some information which is publicly available. Alas you seem to have a lot of people pissed off at you, and I can't speak for them.

Just trying to be nice here :-)

Hi Tim,
I had 2 of those and sold them both. I can tell you that the
hard drive is powered from the power connector on the motherboard next to
the power supply connector. I found from experience that the ST's power
supply can't handle the drain from the hard drive. I even used a beefed up
Best power supply and had the same symptoms (screen flicker, drive resets
etc...). You may find a power connector at Best Electronics or B&C
Computervisions.

The ICD Link II is a much better way to go IMHO. I have one on a mini
tower with 5 hard drives, a cdrom and a Sysquest 200 meg drive that runs
flawlessly.

There are no USB-Drivers for any Atari yet. I think it would take much
more time to develop these for the first time than using a simple
PS/2-interface.

Another problem is that by now there are more ps2 peripherals lying around
than USB...

But i still think USB is better since you can not only connect mice and
keyboards but a lot of other peripherals like usb harddisks scanners and
stuff....

I wrote a program that did this. It had a CCITT DTMF keypad which was
reprogrammable for custom frequencies, and did single and dual tone
generation. I wrote it with the intention of using it as a war dialler but
it became more complex.

Marks right. It would take 5 mins to write one, though I used GFA basic and
it took me days cos I was crap :-).

Coda.

And the "sales@vernalelm.com" account on PayPal I think is suspended.
If you click on the PayPal button on the main page you get a message
from PayPal "This recipient is currently unable to receive money."

Someone said the Ebay account of one of them was also suspended.

Yeah, me in particular. First idea is to list all the devices I guess.

Hows this?

Emulators
Video Cards
Network Cards
Scanners
Drives
Accelerators
Ram Upgrades

And that about covers it I guess. Any more to add?

Mark

Not the implied violence, no. However, in reality, such dodgy dealings
do come back to get you.

I once bought a car that had been MOTd (a safety test) just a week
before, and the garage had passed it despite the undercarriage being
rotten beyond any safe standards. The seller didn't want to know, as in
their opinion it had passed an MOT. I decided that the people
responsible were the ones who were going to reimburse me.

Now, with 16 year old cars, you don't expect much luck. However, I
walked away from that garage with ï¿½700 and a VW Scirocco worth another
ï¿½700 in exchange for a scrap Fiat X1/9 worth nothing and an older
Scirocco worth ï¿½120. (I drove in in one, and was expecting ï¿½1000, they
only had ï¿½700 on them, so I offered to trade my 1983 1.6 Auto for their
1987 1.8 GT-S). I didn't threaten or intimidate them in any way, I just
pointed out that if I had disposed of my X1/9 to any interested party
for my asking price, I wouldn't be able to call the Vehicle
Inspectorate who would examine it and scrap it, leaving me with
nothing. They clearly felt sorry for me, and their decision had nothing
to do with the fact that they would lose their business.

Oh, and for whoever was being mildly racist - the garage owner was
considerably larger than me and had access to many tools. He could
easily have threatened me with violence. Generally when people who have
done wrong are confronted with it in a reasonable and logical manner,
with an easy get-out route, they will respond favourably. Going in all
guns blazing is a bad idea. I believe the term people includes everyone
from WASPs to ghetto dudes to Jews and moslems, and I expect the same
response from anyone.

Richard
(Of course, should I not get that response and get violence/idiocy, I
am quite capable of remaining cool and ending up with what I want
anyway).

I've got an odd graphics card in my MegaSTe and as far as I'm aware I've got
the only copy of this specific driver. Its a Megavision MV300, i can donate
copies of these seeing as how they are now good to anyone but an MV300
owner.

Well this is true but I don't think this is the type of situation we are
dealing with. Consider this shop is a full storefront shop with other

customers around, employees, etc. A *real* business.

Now consider what vernal elm could be. A business designed from the ground up to be fraudulent or at least uncaring about timeliness at all in any way, run by 2 people, possibly not registered, and with possibly *nothing* to lose. In fact, from what they wrote, they're suggesting that showing up at the business address's door step isn't good? Well why not, it's a business? This is all hypothetical, I know nothing for sure, but a lengthy track record of unprofessional behavior is nothing to flinch at.

Unfortunately, it would seem that we could be discussing two different circumstances.

From: Claude Bourgoin <claude@pivot.net>
Message-ID: <405a5b23_4@corp.newsgroups.com>
Source record: 19800

I wasa wondering if anyone out there has had a problem with the Falcon Keyboard, especially with the space bar. All the keys on the Falcon work fine except the spacebar. When I press the spacebar I do not get any response from the falcon. For example, when I am typing in QED and press the spacebar the cursor doesn't move.

Thanks in advance to all.

Claude Bourgoin

Hi All (and Ewe :),
Reformatting a Hawk 4gig drive on a Falcon, is it normal for my system
to take an hour to react to HDDriver (8.04)? The hard drive light stayed on
steady during that time. After that, a sector test was performed and the
drive light flashed until done. Partitioning went ok!

John

Yes, some drives can take that long, or even longer. That's why
formatting a drive can be a waste of time, as long as it does not have
bad sectors.

Hi Johannes,

>it also works the other way round and many modern mice already have this
>adapter delivered with them...

Sure...
But unfortunately printers, scanners, camera's, memory sticks... you name
it, aren't delivered with these.
BTW, *modern* mice and keyboards use bluetooth technology....

The cost of adding extra USB and Firewire ports to the computer are not
worth mentioning, even if there are no drivers, these ports *should* be
included. It's not like a new clone makes its appearance on this platform
every month. If it ever materialises I would like to see not only USB &
Firewire but also an S-ATA interface and the brandnew PCI-X interface
included as well. Unlike a PC this computer will be used much longer then
a couple of measly years, so the developers *got* to make sure that the
very latest technology is incorporated.

Besides, USB and/or Firewire are a must...
What would you propose to a prospective buyer who's planning to attach a
scanner and printer to it? To go and look for something suitable on ebay?
This is 2004, I expect a new computer to reflect this. The vapourware they
are proposing right now is already outdated before it's even here, except
for the processor and faster RAM it's identical to a Milan or Hades. Are
the developers perhaps shortsighted? That vapourware computer has been in
the pipeline for three years now....

>we still have linux ;) and as far as i can see porting drivers from linux
>to mint or another os should not be impossible

We? Speak for yourself... :-/
Stop dreaming, wake up, and take a good look around you...

Cheers from Belgium
Dennis

Does anyone no if this is still being worked on? I've checked out the webpage and according to it they are working on it, and it's up to beta v0.13 (16.12.2003).

I'm just wondering if the beta version is available for download.

>spacebar the cursor doesn't move.

It's possible that something has managed to get inside the rubber cup
under the space bar and is not allowing an electrical connection when
you press on it. Unfortunately, if this is the cause of the problem, the
only cure I know of is to strip down the keyboard[0] and clean the dirt
from the rubber cup and/or on the keyboard circuit board.

Just a few things to make a note of:

there is space for 2 cups under the return key, although only one is
used, so don't think you've a missing cup just because the holder is
empty;

when disassembling, sometimes the cups will stick to the circuit board
and then fall off just after it's removed so take care to watch for them
falling;

when re-assembling, I found that by balancing the keyboard face down
between a couple of books, all the cups remained in their holders, and
it allowed me to easily realign the LEDs.

[0] After stripping several ST keyboards[1], which appear to be
identical to the Falcon keyboards, this isn't something I look forward
to having to do.

[1] Usually to fix broken mouse/joystick ports[2].

[2] Whoever decided to put the mouse and joystick ports there still
needs to be shot.

Regards,
David Bolt

I would just switch back to 6.1. I have both roms on my hard drive
and use one version when my situation calls for it. I mainly use
Magic 6.1 since the MagicNet Cab.ovl file is not compatible with
Magic 6.2.

Sam,

> The reason I'm asking is because I kept those two demos from my ST days,
> and I would like to be able to run them again.

I didnt meant to pull a joke. VERY small ammount of ST demos will run on any non ST machine. With respect to your taste, there is many many better demos as those 2, for which its worth to have ST and/or STE. Demos which use overscan, can also be picky about ST variant (ST vs STFM, not ST vs STE), so on Falcon there is not much hope demos will run. Backward allows many ST games to run on Falcon, but more complex (or if u wish dirty writen) games and demos generally dont run. So either, u have spare ST/E for demos/games, or Steem.

OK, I'll get around to this, remind me if i don't do it soon!.

I don't actually use the PAK'd beast much at all these days, I've got a
Pentium powered XP-Pro toaster that does everything i want within just a
handful of apps.

Perhaps I'll put it on ebay one day and see it fly past the Falcons!!.

sorry if this posted more than once!

Hi All (and Ewe :),
Reformatting a Hawk 4gig drive on a Falcon, is it normal for my system
to take an hour to react to HDDriver (8.04)? The hard drive light stayed on
steady during that time. After that, a sector test was performed and the
drive light flashed until done. Partitioning went ok!

John

Porthos LOOKS really nice to me and I'd probably spend money on it as well
except for the unfortunate problem that I have *never* gotten it to render
a single pdf page ever without crashing. Even it's own user manual. It
simply does NOT work for me on ANY machine, any platform, magic or mint.

I'm not a racist nor a bigot. You live in west Philadelphia, PA, USA for a couple years and see how you feel. You can't beat down the statistics with a 10 foot steel pipe. They're right there in black and white (no pun intended).

Most black guys are large - I won't fight them. Stereotypical maybe, not racist. The inner city types can be very threatening and as a result of their wealth or bigotry against the rest of society don't have much to lose.
Most jewish people are more hrmm.. normal sized. As in more easily intimidated if need be. In general with all the people I know they tend to want to handle situations without violent confrontation. It's just a general observation - I forgot those aren't okay these days in the politically correct world of Steeve Sweet!

As for being a pussy. Well shit, I apologize for carefully controlling my words on a public forum so that I don't get arrested and thrown in jail for something as stupid and lame as assault or terroristic threats. Yeah what good would it be for my macho image when bubba is pounding me daily behind bars? And besides, why would I want to do something foolish like commit battery against someone who was perfectly willing to have negotiations. My opinion changed more than slightly when they actually answered Rodolphe.

It's just simple strategy not an underlying Dr. Phil type problem that you're looking for. As for bigotry, I'd tend to believe you are much more of a bigot than I ever could be with your sheep fucking eliteness. I've got plenty of black and Jewish friends so.... But I guess since they don't tote guns and drugs and wear gang signs I'm a bigot. Fuck you too.

Man I'd LOVE to see you live in an inner city.

Piss off,
Mark

Flame bait if ever I saw it;-), how well does it bench against a CT2? It
should kill the average TT or F030. 50Mhz isn't it?
Incedently, does it use drivers? Or is it a 100% hardware solution?

Source record: 19832

For one day I did search for the answer. Still it is not clear to me. I want to transfer 300 MIDIfiles on my Atari-formatted floppies to my PC harddisk.

Is there another way than this: 1. Format a dd floppy 'B' in a PC. 2. Go to your Atari. 3. Copy the MIDI files from A(Tos) to B(Dos/Windows). 4. Go to your PC and open the files. ?

I red about emulators. But I am afraid to try. The moment I put a dd (Atari formatted) floppy in my PC-floppy drive, my PC starts formatting it (automatically). I lost a lot nice MIDI files by trying.. :'(

I own an Atari 1040 STFM, Old Tos (1989)

Is there anyone out there who want to give me The Right Answer?

My experience is that that overlay (I assume you mean the recompiled MiNT
one) works perfectly with MagiC 6.20 BTW.

Hello,

> we still have linux ;) and as far as i can see porting drivers from linux to
> mint or another os should not be impossible

I assume you are joking. Do you have any idea about the complexity
of the USB stack in Linux? At our research group, there
was a (talented) student who ported the Linux-USB stack
to another x86 (!) operating system (DROPS) - it took him a half
year of work (it was his diploma thesis). Anyone who wants
to do such a thing is welcome to join the ACP team.

In contrast, the PS2 protocol is very simple and - indeed -
a Linux driver could relatively easy be used.

There is no either-or situation. The coldfire CPU feautures
USB support. Thus, any coldfire based computer can feature
USB for free.

Greetings,
Norman

Hi Gijzelaar-

This would only work if you have your Atari hooked up to an external SCSI drive.... AND your PC has the capability to access the same drive. You can transfer all your MID files onto the external drive, then hook it up to the PC. There is a small program called GemExplorer. It will allow the PC to read the Atari formatted hard drive, but I think it will only recognize the first partition. Does anyone know if that program will allow the PC to recognize an Atari formatted FLOPPY?

I've also heard of linking the 2 computers via the printer port. Maybe someone else can elaborate on that.

Do note that many original disks (notably games) have executable
bootsectors, making use of the same principle of bootsector viruses. If you
erase them with a virus killer or some such program, the original game will
cease working.
Check out www.uvk2000.com for a decent virus killer, that can also restore
many 'original game' bootsectors.

Just in case people looking for one have missed the original post due to expiry...

2 days left on my mint, boxed Falcon. 4Mb, as new, no internal HD. In the interests of making the system pretty much useable, and because I found I have spares, if the auction reaches ï¿½150 not only is the 330Mb SCSI HD included, but I will also include a SCSI CD-ROM drive, and if I find one, a case to hold them (one CD-ROM drive I have is already cased, but it's an Apple case and I'd rather not part with it).

Will ship US, Australia, Europe and of course UK.

Dennis Vermeire assures me that he's shipped several Falcons to the US and they /have/ worked on 110V despite the 220-240V labelling. So it could be the case that the Falcon PSU is genuinely switch mode /and/ switching. I have a 110V adaptor but no cable to try this out!

Auction URL is here:

http://cgi.ebay.co.uk/ws/eBayISAPI.dll?ViewItem&item=3084498216

Of coursethe PS2 protocol is much simpler than USB to include i won't deny
that fact and implementing USB might not be as easy as i thought after
looking a bit deeper at the whole usb driver structure....
But you can put enough of USB handling code into a only 512kb (or even
smaller) big BIOS of a PC that you can use USB mice and keyboards such a
thing would be enough for the beginning... it's of course still far away
from generic USB handling but it would be enough to use keyboard and mice
and we would not need to have a PS2...
And since i'm beginning to study computer siences in some weeks I might
perhapse do my diploma thesis on something atari releated ;) but I hope that
ACP already brought out the board then ;)

I made my cable by chopping the centronics plug off a cable and putting on
my own. Very good
You can also use Ethernet. see http:/hardware.atari.org/ A bit fidley but
quicker.

Hm, all I can say it work just good here on the Hades and TT030 running
freeMiNT 1.15.15/N_AES 2.0.0 and on the Mac G3 running MagicMac.
AFAIK, the only things that are needed are wdialog (in case of MiNT or
Magic < 3) and NVDI 5.0 and newer.

Hello,

No problem here, on my FalCT60 running MagiC! 6.20, NVDI 5.03, as well as on my TT030, same environment.
Found a file causing it to crash one time, then sent it to the author who fixed it.
A great and reliable work IMO, worth every cent I payd for it.

Hello,

Is it the one in the MagX-Net package ?
This one couldn't even print the google page : I interrupted it after 21 timeouts :-(
If not, which one are you talking about ?

Moi!, auther de flame fest, I'm offended!!

I've not compared it against a CT, i don't think there's any universal
software that would do the job not that I've looked anyway.

There is no software involved, its purely a hardware solution.

```
I am trying to get the new version running on my Milan60. I've
not been able to get recent versions working. I think the last
stable one was 0.26

I am running Doom like this from bash:

/d/games/pmdoom.30/doom.ttp /d/games/pmdoom.30/doom1.wad
-video=gem kbd=gemdos mouse=xbios

The window opens for a fraction of a second and I get this
in the Toswin window:

pmdoom-0.30pre3
Game mode indeterminate.
Public DOOM - v1.10
Keyboard.: SDL
Mouse....: SDL
Joystick.: SDL
Sound....: SDL
Video....: SDL
Network..: Unix sockets

M_LoadDefaults: Load system defaults.
Z_Init: Init zone memory allocation daemon.
8192 Kbytes allocated for zone
W_Init: Init WADfiles.
Error: W_InitFiles: no files found
```

This suggests to me that it is not finding the WAD file. What have I done wrong ? Do I have to install SDL ?

Thanks in advance.

>for granted.

You are quite right. Switch-=mode does away with bulky and heavy
transformers, since it works at much higher frequencies where the
amount of magnetic material can be greatly reduced. (It also
pollutes the power suply with harminics - but that's a nother
matter!)

The complication is that /some/ switched-mode power supplies are
auto-adapting to the supply voltage - often anything between 90
and 250 V will do. But I doubt if that's the case in the Megafile
- usually it's things like battery chargers.

My copy works fine on my 14 MB Falcon. So far it has never
crashed, though it can take some time to do anything with large
PDFs. Perhaps you are short of RAM? Or have a corrupted file?

>Is there anyone out there who want to give me The Right Answer?

Provided your Atari disks were formatted to the normal 80 tracks
with 9 sectors/track and double-sided (I *think* all 1040s except
the very first had double-sided drives), you can write a new boot
sector to them so that the disk can be read by a PC. For safety's
sake make a backup copy to another disk first.

The program you need on the Atari is called DISKMOD.TOS and is used
with a file BLOCK0.DAT that contains the actual PC-type boot sector.
The two together are only 8 kB. If you can't find them on the web,
I could mail them to you. Can you handle MIMed and ZIPped files?

Alternatively, set up a large RAM-disk on the Atari so that you
can copy the whole Atari floppy to it in one go, then copy out of
the RAM disk to a DD floppy formatted on the PC (presumably your
machine can format DD disks - Windows XP for instance can't, only
HD disks :-(- and that's meant to be progress?)

Doesn't help. The manual just says to return the Falcon to its
original configuration. I know they are supposed to be 33 Ohm
resistors, but what traces were cut or modified when installing the
74F04?

For that matter, the data regarding the clock modification was in the
with solders/accelerated bus section. Since I was not attempting to
accelerate the Falcon's MB, I hadn't thought the section applied to
me.

> kbd=gemdos mouse=xbios

You don't need to do all that. I updated the README files to show what the
current Atari specific command-lines are. The old ones are not valid
anymore. Just put the wad and program in the same directory, and run the
program:

$ ls
doom1.wad doom.ttp
$ ./doom.gtp -sound off

I just advice to add '-sound off' because the current audio part of SDL on
Atari is not good.

You can also just double-click the program if you're a GEM addict,
provided the window where the WAD file is, is the active one.

> W_Init: Init WADfiles.
> Error: W_InitFiles: no files found
>
> This suggests to me that it is not finding the WAD file. What have I
> done wrong ? Do I have to install SDL ?

The WAD file must be in the current (active) path. You can not specify it
on the command line (only additionnals WADs).

You don't need to install SDL, except if you want to code SDL applications
or games. SDL is used for Doom, because I put as much auto detection I
could find, so what SDL finds for audio, video, etc... should work without
any hassle.

Write protected?? If not you only have to blame yourself for the loss...

Any "non Windows" floppy that you put inside a Windows (-95 and up, I
think) computer will be written to (in the bootsector) even if you only
list the contents in a window! Sic!

>> I own an Atari 1040 STFM, Old Tos (1989)

Must be TOS 1.4 then? If the floppies were formatted with the desktop
format function (DS, 9 sectors, 80 tracks)they should be readable under
Windows right away. TOS 1.0 (1985) and TOS 1.2 (1987) are different.

At least Windows 2000 can actually format DD disks as well. But you can't do it the "normal" way. Use the FORMAT command with proper arguments in a DOS window to format DD disks.

There may also be an alignment error between your floppy drives.

there are some "unformat" utilities out there... but i'm not sure if they
help in this case...
you can also try to run a data rescue progrma over it but i don't know of a
program that can retrieve midi files automaticaly...
the last resort could be trying with an hexeditor... but that is only if you
know the file /filesystem structure....

and probbaly windows did not quickformat the disk but formated it completely
so the chances to retrieve your data are quite small....

There's a good chance it will work, I've had 26Inch widescreen TV's running
on 80 VAC on a variac before now, its a required stability test for some
makes.

Thanks Jon.

I got it working finally. I had a scrap 1040 PS that I stole the connector from! I hooked up a really slim SCSI Quantum Trailblazer 810MB drive and she seems to be working fine... Hopefully I won't have a power issue....

I also have problems getting the newer version working. Doom 0.28 is the latest one I get working. Newer binaries will show the background pic at load time, and then freeze.

Interestingly, same thing seems to apply to Heretic: I only get 0.24 release working. This makes me wonder whether it might be something with SDL?

Regards,

Joakim

2177. Arcview Help

Newsgroup: comp.sys.atari.st
Date: 2004-03-21 18:17:27 UTC
From: peterslegg@===ANTI-SPAM===scubadivers.co.uk
Message-ID: <405ddc37.0@entanet>
Source record: 19765

I seem to have done something that has broken Arcview.

I am still able to open and list the files in a Zip but
it is not possible to extract or view any of the contents.
It just reports this error:

Error -34 while Dsetpath(\tmp\ARCVIEW.TMP\)

and bleeps.

On my G partition there is a /tmp folder and inside
that there is an ARCVIEW.TMP folder when arcview
is running. I am using Arcview 0.82

Any ideas ?

Regards,

Peter

2178. Re: DOOM V0.30 release !

Hi,

I also cannot get pmdoom.030 working with my Milan 060, I tried
various command line args but with no luck.

The furthest it gets is when I specify the fullscreen mode option, it then
gets just past the 'init playloop' message. Not sure where exactly because
it disappears of my screen too quickly.

Also have any Milan 060 owners had any luck getting Running2 working?

Richard.

I don't know, because my Atari can't read a dd floppy which is
formatted to 720k on my Win98 PC (in dos). "Data on the disk in drive
B: may be damaged".
That points to an earlier version than 1.4 I think. Don't you?
Dos tells me the disk had 730112 bytes free space, Atari says 728064.

cut

Thank you -and all others- for answering.

Thanks. I'm only connected to internet by my PC. The problem remains
how to put the programs on my Atari.
I still prefer a soloution for my Win98SE PC (no XP for me, I don't
like that look&feel) so that it can read an Atari-formatted floppy.

No, it does not. Might be an alignment error. Does the pc and Atari read
other floppies written by other computers well?

I had a strange behaviour here. Windows -95 pc could read all my Atari
floppies, both DD and HD. It could also write HD floppies on the pc
readble on the Atari side but not DD!!

If I tried to write anything to a DD floppy with that pc it could read it
itself afterwards but none of my Ataris ("Data may be damaged"). Really
strange as it worked perfectly with HD formatted floppies.

This was btw how I first discovered that Windows _writes_ to the
bootsector of any floppy formatted on a non-Windows computer: bootsector
no longer readble on any Atari.

>Dos tells me the disk had 730112 bytes free space, Atari says 728064.

Nothing to bother about.

Just a tip:

format a DD floppy on both your Atari and pc and find another pc and test
both floppies. This might get you on the right track to find out what

your problem is.

Hey guys,

Just to let you know 0.30 works perfectly on my falcon with or without
sound. Thought it might be pertinent.

From my personal experience, nothing but formatting on a PC works.

Yes, windows 95 was the only version of windows that followed the microsoft boot sector standard. It would read any disk, formated to any number of tracks and sectors, because it had to read 1.62 meg disks for their last floppy disk distribution of windows.

After that, and I forgot what version, a PC could read a disk from my TT, but a windows application could not read it. Whatever they had for a file selector could read it, and then clicking on the file name opened the application. In simpler terms, I took an Excell file to Kinkos to print, and the fellow there showed me a workaround that worked.

The last time, on Windows XP, my TT's disks were not read. I formatted one there, tried it in another PC with Windows XP, and it read, took that disk home to write on it with my TT, and took it back to the Windoze XP machine to do something with it.

It is not a matter of alignment. I do not know what it is a matter of.

Do have MiNT. Have not tried making the floppy drive a long file name drive, and that might make a difference.

But until and unless, I would not assume that a recent Windoze version will read a disk from my TT, which does not have a wrong-boot-sector problem. Windoze sucks, yes.

Jim

Hi agai Gijelaar-

I just tried "GemExplorer" and it works for floppies too. Very simple to install on your PC. Once you read the floppy, you can drag and copy it to a WhineDoze folder, and read it with your PC. The program is very small, and you should be able to find it using any searcher. The intro text to the program says it will allow your PC to read Atari formatted floppies and hard drives. I think this should do what you need. I tried it using a file I created on my older ST (I now have TOS 4.04 in my Falcon) and it was NOT recognized by the DOS reader, but it WAS recognized when I clicked on "Read non-DOS disk". I was then able to copy that file to the PC's hard drive, and access it with the PC.

Hope that helps,

-Clayton Murray

> >> Just wondering if its worth finding a fpu for a falcon030,
> >> and what apps take advantage of it?

Add to the list of known apps posted here so far:

These have FPU versions for sure:

Photoline (Disks have ST and TT(030) binaries...with and without FPU)
FPU is well worth it with Photoline! Does not use DSP at all that I know
of...
Studio Son (Distribution includes with-FPU and without-FPU binary...uses DSP)
FPU nice to have for this one, but not essential.
PovRay (versions for both, with or without FPU)
FPU well worth it for Ray Tracing!
Pretty much anything you compile on your mintnet setup with the fpu flag enabled
that actually does floating point math. Also, there were quite a few
precompiled binary packages for mint set to use a 68020 or better with FPU.

Might use the FPU if present?
True Image/True Paint (Uses DSP when present for sure!)
Zero X (Manual mentions it briefly, but there is not a seperate binary)

No...CueBase Audio does not use the FPU.

Brian

Strange xperiences do you have! Like life. You can't tell a boy fits a
girl with the same age, but sometimes -don't ask me why- it does. ;-)

This was my experience...
: I tried also to copy -on my Win98SE PC- from floppy to harddisk in
MS-Dos mode. This failed too... Normally! I discovered just yesterday!

I put 'MF-2DD' floppies of TDK ('80Tracks-135TPI')and MCN (some Dutch
label) in my floppy-drive. My computer -in dos-mode- could read
them!!! I looked for the disks which were unreadable; they all were
'MFD-2DD' from Sony. So in my mind grows the axiom that it's about the
difference between MFD and MF or the brand/label, but maybe it's
something else.

Unexpected, my problem is solved. That's to say 'moved'. Because the
midi-files were not readable on my PC :'(.

Sounds like you've broken something - have you got something like this in
your env variables?

#_ENV TEMP=L:\ArcViewTemp\

I suppose I could have left the folder name out, ArcView would then have
created its ARCVIEW.TMP folder in the main directory.

The temp folder is needed for ArcView to extract to even if viewing a file.

Latest ArcView version is 0.83 BTW.

2192. What's it worth?

Newsgroup: comp.sys.atari.st
Date: 2004-03-22 18:02:10 UTC
From: jon
Message-ID: <mSF7c.15866$xg.14224@fed1read04>
Source record: 19781

I need some input on this.

First, let me describe the system:

Mega ST2 upgraded to 4 megs ram
Extra Mega ST4 for parts with working motherboard/PS
ICD Adspeed 8/16 processor upgrade
Megafile 30
Megafile 60
Mono Monitor
Pristine SLM804 laser printer (w/new drum and 3 toners $200)

This was Atari's DTP system with 2 added hard drives.

Due to my anal attitude when buying this stuff, there is no yellowing anywhere and all this stuff works like a charm. What I am looking for is a realistic value on this stuff. If there are any offers also, I will entertain them.

Thanks

Probably $50-100, depending on demand.

> Extra Mega ST4 for parts with working motherboard/PS

Included above.

> ICD Adspeed 8/16 processor upgrade

Hmmm. Probably pushes the above combination to around $150.

> Megafile 30
> Megafile 60

Probably $50.

> Mono Monitor

Included.

> Pristine SLM804 laser printer (w/new drum and 3 toners $200)

Difficult. Maybe $100? So maybe $300-400 for the system depending on
who you're aiming at.

eBay is always a good way to get a value.

Some people on here may suggest it's worth 50 cents, though ;)

>B: may be damaged".
>That points to an earlier version than 1.4 I think. Don't you?
>Dos tells me the disk had 730112 bytes free space, Atari says 728064.

730112 is the normal Atari readout. Perhaps the diskl has some bad
sectors, or more reserved for the boot sector than the normal 1
cluster of the Atari.

BUT all Ataris should be able to read PC-formatted disks - it's
the other way round that gives problems with TOS before 1.4! As
suggested by someone before, it's possible that your head tracking
is out. What happens with Drive A:? Or is that single-sided?

2195. STEEM and Xenon 2: can't get keys to work as joystick

Newsgroup: comp.sys.atari.st
Date: 2004-03-22 20:56:59 UTC
From: Ben Hall <benj@seriously-productions.freeserve.co.uk>
Message-ID: <c3nk58qec1@newsg2.svr.pol.co.uk>
Source record: 19784

Hi guys,

I'm having a little noSTalgia with Steem. :)

I can run Xenon 2 fine (Automation version) but for the life of me cannot get the game to work with the keyboard as joystick. It is setup correctly in Steem's joystick config pages, and when I press the mapped keys on the keyboard the onscreen joystick moves fine - however, when in the game, the keys have no effect.

Anyone else got this working or had similar issues..?

Cheers,

Ben Hall

ColdFire or PPC is the current way for projects. But it's just projects !
ASM programers prefer ColdFire way (most compatibility with 68xxx than PPC)

> Which OS would it run ?
>
> AtariOS 4.0 pureRISC ?
> GNU/Linux PPC ?
> MacOS X._ ?

MacOS is not ATARI !

Falcon + CT060 (expensive, but the best hardware)
http://www.czuba-tech.com
and possibility to add (in futur) a ColdFire or a PPC

or

A PC with Linux and ARAnyM (power without the price !!!)

Now Richard's auction has finished I may well start mine... main
differences being no official box but with additonal 14Mb Ram, 170Mb
or 1200Mb, PC keyboard interface, RGB and VGA adaptors, spare
keyboard.

Anyone wishing to make pre-Ebay offers by all means email me methanoid
AT hot MALE dot KOM unless your name is Rual!! ;-)

I take it you're quite relieved that Falcons aren't worthless after
all, then :)

Richard

What is head tracking? I could not find it on the internet.
Drive A? It's my only drive and it is double sided.
Thanks 4 bothering

In the mean time I discovered that my computer can read some
Atari-formatted disks.
In DOS mode it can read 'MF-2DD' floppies of TDK
('80Tracks-135TPI')and MCN (some Dutch label). All the Sony 'MFD-2DD'
floppies were unreadable.
With Gem explorer I can read the same floppies plus SOME of the Sony
ones!
Strange!

Thanks.
In the mean time I did discover my computer can read some
Atari-formatted disks. (In DOS mode it can read 'MF-2DD' floppies of
TDK ('80Tracks-135TPI')and MCN (some Dutch label). All the Sony
'MFD-2DD' floppies were unreadable.)

With Gem explorer I can read the same floppies plus SOME of the Sony
ones!
There is some profit here.

2217. Software for sale - final week

Newsgroup: comp.sys.atari.st
Date: 2004-03-24 08:27:20 UTC
From: Stephen Moss <sgm23@eng.cam.ac.uk>
Message-ID: <c3rgmrhvh1@pegasus.csx.cam.ac.uk>
Source record: 19706

Just one week left so if your interest in something better say so now.

All items are original and complete with boxes, manuals and overlays
(where applicable) and are all in as new condition unless otherwise
stated.
All prices include postage - US purchaser should add £2 to cover the
additional postage costs involved.

List updated (24/3/2004)
ST Software: £5.00 each unless stated otherwise

Archer McClean Pool: **** NEW ITEM 24/3/2004 ****
UK 8 Ball, US 8 Ball and US 9 Ball pool from the programmer of Jimmy
Whites Whirlwind Snooker.

Battle Command:
Airdropped by Stealth Helecoptor you must use your Battletank to
compete various missions, extra
weapons become available upon mission completion (weapon depends upon
mission).

M1 Tank Platoon:
Tank commander simulator - mission based, command your 4 tank platoon
and various support units
in night, day, summer and winter action against the red forces, youcan
also take direct control of 4 positions in any of the units in your
platonn.
1 Meg required.

Dog Fight:
Flight simulator, complete missions in WW1, WW2, Vietman, Falklands,
Sirria, or dogfight any two planes against each other
1 Meg required.

TV Sports Football:
American Football (no box) - £3

Corporation:
Infiltrait the Corportation in this 1st person game use guns, bombs,
electronic lock pick
and other devices to find the corporations evil secrets. (Box scuffed
along edges)

Reach for the Skies:
WW2 Flight simulator, fly for Germany or Britian, you will end up
looking around for those 109's

Leisure Suit Larry 2:
Serria adventure

Dragons Lair:
Don Bluth game, not much game play but excellent catroon style
animation, see what the humble ST
can really do (originaly cost £50 - eek)
1 Meg required.

Speed Ball 2:
Beat Em up handball/basket ball cross, similar to Rolarball if you've
seen the film.

3 Pack (Basic, Warp 9 & GDOS-E):
Basic - Metacombo, UK revised edition as supplied with new ST's (no
box)
Warp 9 - screen accellerator V3.72 (no box)
GDOS-E (disk only)

Payment:
========
I will accecpt payments by PayPal, UK residents can also pay by cheque

If your interested in any of these items please PM me by 1st April
2004, thanks,
Stephen Moss

Well I've got the normal tmp directory stuff in mint.cnf:

setenv TMP u:\tmp
setenv TEMP u:\tmp
setenv TMPDIR u:\tmp

but that hasn't changed in ages.

>I suppose I could have left the folder name out, ArcView would then have

I seem to remember this error popping up now and again when using Arcview
but it never seemed to make any difference. I must have changed something
but I am struggling to work out what it is at the moment.

If the ST has a HD drive installed and working (with applicable TOS
version), Yes...

Hi Atarians

Age has at last caught up with me or Im more senial than I thought. I know the answer is out there somewhere but I just cant bring it to the fore.

What the heck am I bubbling off about ? Well Ive benn going through my floppy disc collection and some I bought as a job lot at a boot sale.There are a few with an IMG tag (but not pictures) and some text that quotes base 64, I have completely forgotten how to use either. Could someone please elaborate and point me in the right direction.

With thanks

Derek

A question like "Can an IBM compatible pc read HD floppies?" can't be
answered either...

But to help you a little further:

Yes and no. Depends on TOS version. With proper hardware and 2.6/3.6,
yes.

>> >formatted to 720k on my Win98 PC (in dos). "Data on the disk in drive
>> >B: may be damaged".
^^
>Drive A? It's my only drive and it is double sided.

I asked because of the quote above. On the Atari desktop, if there
is no second floppy drive, you still have two icons on the desktop
which refer to different disks A: and B: in the same drive - that
way you can copy one disk to another (albeit slowly, because TOS
does it file by file). Before you got the above message you must
have told TOS to read B:

>What is head tracking? I could not find it on the internet.

The drive contains a servo mechanism that keeps the read head in
the same relative position from the centre it was in during
writing - in other way ensures that during reading it follows the
same path as during writing. That servo system controls what is
called head tracking, as it keeps the head on track(s).

>In the mean time I discovered that my computer can read some
>Atari-formatted disks.
>In DOS mode it can read 'MF-2DD' floppies of TDK
>('80Tracks-135TPI')and MCN (some Dutch label). All the Sony 'MFD-2DD'
>floppies were unreadable.
>With Gem explorer I can read the same floppies plus SOME of the Sony
>ones!
>Strange!

Could be due to differences in the magnetic material, but normally
DD disks are much of a muchness. Perhaps the magnetization has
faded for some reason on the Sonys? Try reading them on another
computer if possible.

Regards, /Peter/

> point me in the right direction.

IMG extenders should be bitmap images, but they possibly may by
disk images for use on an Atari emulator.

base 64 is a mimng format that allows 8-bit binaries to be sent
over servers that only handle 7-bit code (i.e. up to ASCII 127)
which includes all letters, numbers and a few punctuation marks.

A PC with WINZIP will usually decode this automatically. On an
Atari you need something like MUNPACK.TTP or ESS Code to convert
it back to 8-bit, using the MIME decode function. Normally such
messages are also archived with ZIP or LZH before miming them, so
you need suitable archive programs (ZIP.JR, UNLZH ...) to obtain
the final version.

2244. Re: the other way to put an atari-formatted floppy in a pc-floppy drive

Newsgroup: comp.sys.atari.st
Date: 2004-03-26 01:02:38 UTC
From: Jim DeClercq <jimd@panix2.panix.com>
Message-ID: <c3vvfe$842$1@reader1.panix.com>
Source record: 19733

Head tracking, head alignment. Used to be a problem, and some people in
school computer repair labs were good at bending the head into proper
position. I have a head alignment disk, which runs on TOS 1.0 only, and
cost a bundle.

My take on this is that drag on the head guide rails causes the modern
version of this problem, and when I have had one that did not seem to work
right, I put a toothpick-sized drop load of light oil on the rails, and it
worked again.

Today it seems to be a solved quality control problem.

Jim

Which style internal floppy drive do you need? Atari used various sizes and models over the years (the older style had the trapezoidal shape faceplate trim). I do have one of the newer style (1" high) drives left over from my Computer STudo parts department. Its a brand new, never used, Epson SMD-380 with Atari's rectangular face plate installed (the type used on later ST models). The original Atari price for this replacement drive was $120 (Zoweeee, those Atari parts were really expensive back then). You can have it for $20 plus shipping ($5 within the continental US lower 48 states only) if you want.

Sheldon

I found it :-)

It's my own fault (naturally) I have been trying to disentangle some
utlities from the N_aes folder so that eventually I can switch to
XaAES without too much problem.

Anyway to cut a long story short I missed one entry in the
c:/N_AES/M_AES.CNF which should have read:

export TOSRUN=c:\gemsys\apps\tw-call.app

tw-call must be involved in what ever mechanism allows Arcview
to call the archive program.

I often wonder about these little Mint utilities. Are they updated
often ?

Regards,

Peter

Yes, something seems to be broken probably the CFG file. Can you
extract LZH files? Might be the "extract" command for the ZIP
files is messed up or else the path is screwy. YOu just want to
re-install it again. BTW, I have version 0.83.

Yes if the ST is equipped with a HD drive which would take some
modifications on the ST. I have a Hades060 which had a HD drive in
it and it can read HD PC disks with ease.

Source record: 19742

The sources for NEWSie has been released under GPL.

From www.atari-users.net:
==========

Yes, that is right: NEWSie! This application has probably been the
first internet application for many Atari users through the years,
offering support for usenet and pop-mail as well as ftp. Even though
NEWSie has not been updated in ages, it has been put to good use by
many users that are active on usenet. As any application that has not
had an update for years and years, there are things that isn't working
as smoothly as one might wish. And also bugs that would need to be
squashed.

For anyone interested in either doing a major rehaul, fixing bugs or
perhaps just learn more about how to do FTP/USENET/POP-MAIL, the
sources are now available

==========

Regards,

Joakim

Hey, for an Atari program that is pretty darn good. I know another
upgrade is coming as I was talking with it's author about some
little quirks I am experiencing. Still, I love the program....

I had news : we exchanged several emails and arrived to an agree :

They send me again the CPU.
They proopose too 20% rabat at them for all of you who helped me to contact them.
I inspect in france to see if the packet is not somewhere.
I remove my complain at BBB conecticut.

I just ask them if I can do a public announcement with that and explain why they never received my emails after october 8th (technical server problems)....
It was the 18th ...

Since this day, received nothing from them ...
I sent 2 emails after to be sure...

I understand nothing to what happens :-(

PS : I checked french post and DHL and no packet in standby ...

I have seen Falcons sporting faster than 16MHz on the net. How are they doing it? I have seen 24MHz, 30 and up to 40MHz. Are they simply overclocking the 030? Is it just as simple as swapping out the oscillator?

Tim

2262. Question on the "ancien" game Starglider 2...

Newsgroup: comp.sys.atari.st
Date: 2004-03-27 07:13:08 UTC
From: St&#65533;phane Smirnow <smirnow.stephane@brutele.be>
Message-ID: <c439i5$cg0$1@news.brutele.be>
Source record: 19651

Hello all,

I played again that game on my old Atari ST, but this time (13 years after I first tried it) I really try to finish it. My actual problem is that, following the story book, I should destroy the Egron projectors on the Millway planet's moons to slow down the main beam base contruction. But in the game, when you destroy one of those base, you don't even have time to leave the moon and go back to your home planet that the base is already reconstructed. Shooting bases after bases should not be a big deal, but in that case you would not have enough time to jump from planets to planets to find the needed composants of the final neutron bomb, before all the destroyed base are rebuilt again! Furthermore, the main time counter is designed to go to 9999 units, and only after 0750, even after having destroyed one Egron base (just for the fun, true), the main beam base fired and destroyed the far distant home world. The game continues after that, but that should be gameover. Is it a bug? A time synchronisation problem? Does anyone remember what should be do to prevent such an end?

Thank you very much for any help.

Stef

Hm, Newsie is not my thing. For some reason I never loved it. In the
past I tried to used it but ... no love at all. My favourite newsreader
is Okami. Unfortunately the developement of Okami seems to be stopped.

Anyway, I'm glad to hear Troll doesn't work for you too. On my system I
can't get Troll pass the authentication.

No, The CPU shares the clock with some major components on the motherboard. You can need to isolate the clock between the CPU and the rest of the motherboard.

You may see figures like this: 50/25mhz, or 32/20mhz which means CPU is 50 Bus is 25, and CPU 32, BUS is 20 respectively. The clock in the standard Falcon is 32mhz, which gets divided /2 to feed the CPU and bus. You could just put a 50mhz crystal in there to get 25mhz cpu and bus, but then you will find that the keyboard/mouse/midi doesnt work. The DMA divides the 32mhz clock to give a 500khz signal to feed the ACIA chips that drive the keyboard, mouse and MIDI, so If you do this you will have to also cut off the ACIA clock and make another 500khz signal (theres not another one on the board anywhere) and connect it to the ACIA.

The CT60 card is going to be produced again in the next few weeks, and orders are being taken at www.czuba-tech.com , if you can afford one, this is the fastest card yet for the falcon. If not financially viable then you should be able to find someone willing to part with an Afterburner or CT2 accellerator. If THAT is still too costly, then you should be able to make your own cpu accellerator if you look at this page: http://atari.nvg.org and click on hardware. There are accellerators for your DSP and FPU there too.

Hope this helps.

Here in belgium many people drive through the red traffic lights, so
that's good?

It's not because many people use it that it's good. I bet 95 % of these
html-users doesn't even know they use it. It's just because their pc comes
with a faulty installed mailer that html mails is so widly used.

>STe at 4meg.

Yes, I can confirm that Porthos will only run on a multi-tasking
system. The manual says (in German):
--QUOTE--
Porthos requires a multi-tasking operating system. It was written
for MagiC, but it should also be capable of running under MiNT or
MultiTOS. In addition you need:
NVDI Version 5.0 or later
WDIALOG (is included with MagiC from 3.0) or N.DIALOG (under N.AES)
BubbleHelp (for calling up on-line help with the right mouse button)
(Optional: PAPILLON (from ASH) for exporting graphics
--UNQUOTE--

Note that with MagiC 6 or later you probably no longer need
WDIALOG, as its routines have been incorporated into MagiC.

4 Meg is a little tight for Porthos, but it might work with short
PDFs. Longer ones are likely to exceed your memory capacity.

Regards, /Peter/

While I agree in principle, that's unfortunately not a very practical stance for us to take, I think. Even though it was not *intended* to be used with e-mail, it very often is, and our protesting it won't make it go away - it will only force us to deal with the fact that one day, a few years down the road, we may not be able to read most e-mails sent by non-atari users.

Just because some think it's an improper pairing, I think it is incredibly naive to stick our heads in the sand, *not* make an html-compatible e-mail program, and complain bitterly when we can't read e-mails. I personally don't see this as a battle we can win by protest, and I don't see why we even have a need to fight this one, because it's one that's going to happen whether we accept it or not. And at this point, wouldn't it be better to add one more tool to our arsenal than to purposely limit ourselves out of "principal"? Not a smart move, I think.

It's like a discussion I read in here about 6 years ago: "Javascript will never really take off as an internet standard, so there's no need to work on including it in any Atari browsers - HTML is the only proper web format," was the basic concensus, if I remember correctly. So now we're stuck here with barely functional browsers, trying to play catch-up.

I'd hate to see this same mentality bury our e-mail programs, too!

Just a thought...

No BUT the alternatives to traffic lights no longer meet the needs of modern
traffic.
We could go back to policemen directing the traffic but lights work much
better.
I am also sure that red lights were not designed to control traffic.
I expect that when we started some ladies of the night complained that
customers would get confused.

What are the (rich text) alternatives to HTML mail? They are all proprietry
standards.
Business Users, especially the "sales droids" want to send e-mail using rich
text.
Prior to HTML formats they used proprierty formats such as Microsoft and
Lotus notes.
To my way of thinking HTML which is a BIG improvement over these.

>html-format.

I agree, e-mails should not be sent in HTML, but sometimes they are !
Using Okami I can usually view them in Highwire or CAB, unless they use
"embedded HTML". (I don't really understand this - I just know Okami
can't display it !)

This brings me to my "wish list" for any modifications that might get
done to Newsie.

At the moment it has a built-in ability to call CAB if a URL is displayed
in a newsgroup article. I would like it to be able to call the default
browser (which is now Highwire on my system).

I imagine it calls CAB if a URL is displayed in an e-mail. (I don't know
for sure as I use Okami for mail) if so, then again, it should call the
default browser.

I would like better sorting of newsgroup articles in the article overview
window. At the moment, they are only sorted by article number and/or
thread. I would like to be able to sort by date, or at least reverse
number order, so that the most recent article can be made to appear at
the top of the screen.

I would like to be able to quickly select text from within an article and
copy it to the clipboard, or drag and drop to another window. (At the
moment I have to save the article as a .TXT file then select text from
that.)

I would also like to be able to save a URL direct to the clip board, or
drag and drop it elsewhere.

I know not everyone is a fan of Newsie, but I remain to be convinced
that there is a better news-reader for our platform. It offers the
ability to select which posts to download, either by number, or by
looking at the headers and choosing those required for later offline
reading, or they can be viewed direct whilst online.

I hope someone will be able to do a Newsie upgrade (sorry - I can't programme anything more complicated than a VCR !), and look forward to seeing it one day.

Cheers

Paul

Have to agree with you 100 per cent Mike.

My main reason for using one of these PCs running Windows/Linux is to be able to read emails in whatever form they come, browse web sites without problem, and lastly do audio recording quickly and cheaply, and easily. Even my 14Mb Falcon can't do that for me any more, hence it is gathering dust in the garage.

But give me a good set of programs able to handle most stuff thrown at it on the internet and I be back to using an Atari daily.

We do have to get along with the majority, even if strictly speaking the rules are being broken. But I still only send emails/postings in plain text!

Sure, and it is extremely annoying. Many do this without even knowing,
since some email clients have HTML output as default setting. Which is
not that good IMO.

However, if the HTML debacle is properly MIME encoded or sent as
attachment, there should be no problem with displaying the stuff in the
web browser of your choice. Unless I am missing something here?

Personally, I would however not prefer to see HTML rendering embedded
in an email client, mostly since I don't think it belongs there.

I would never buy from a "hit and run" operation like that if they take
a year to reply with the "possibility" that they will make good on their
"error"! I've sent faxes to them for Rudolphe and no reply but I hear they
reply to new orders! I say they should be shut down (after Rudolphe get's
his order, of course :)

I don't agree. _Any_ E-Mail I've got that was in HTML format was UBE/UCE. Any user willing to talk to me has simply got to use plain text, and I'll tell him/her how to do so if necessary. And if everything else fails, I could still view the text with a browser.
That's for my personal accounts, though. At work, there happen to arrive html e-mails, but there I'm using Mozilla. And that one has a preferences switch, that allows for setting the mail type (plain text or html) for any user in the address book.

With best regards
Ekkehard

Ever tried Okami? IMHO, it's the best (off-line)mailer available for our
platform. It runs on every OS (some probs with Geneva though).
It's not that easy to set up but once done it's worth the pain.
It needs Popwatch/Newswatch to retrieve mails/messages and that is the
weak point. Both needs to be updated. Unfortunately the author seems to be
disappeared from earth.

Myself have used it some time but found it rather unstable on the TT030.
I've tried it to make it running on the Hades using kernel 1.15.12 but
this test failed for some reason.
However years ago a friend of mine has used MiNT 1.12/MiNT-net/Geneva on
his TT030 during a long periode. He was very pleased with it.

Can anyone tell me the proper way of setting STIC up. I'm running Magic 5, and Mytask 1.2. Mytask needs stic, but I'm having problems with stic.

Thanks in advance,

Almost any drive will work. The issue is whether there are jumpers for drive select or not. Because PC's floppys are set to drive 1 (B) at the factory for historical reasons this needs to be changed. I havent seen any floppy drives recently with actual movable plastic jumpers, but I had to replace my Falcon's drive 6 months ago, there were some tiny solder pads called ds0 and ds1. ds1 was soldered, ds0 was open. I changed them around and that did the trick.

Try looking at the drive before you buy it. Even if you have to pay a couple
€ more than you can get one online it will be worth it to not have to send
it back.

Coda.

That statement doesn't argue your point at all. These are completely different issues. No matter what anyone thinks, people can get killed if someone runs a red light, which is why it's not a good idea. HTML in e-mails has nothing to do with a life-or-death situation, and is thus as very subjective argument.

I personally don't use HTML in my e-mails. I agree that it isn't a proper usage for sending plain text. However, I think it *can* have its uses, and is therefore not entirely a bad thing.

I also believe in the freedom of choice. Let the user of the program decide to turn it off or on, rather than one group of people dictating that it shouldn't exist at all because they don't like it or agree with it, leaving the rest of us stuck without an e-mail program that works anymore.

Make it a setting in the program that you can turn off or on. If you don't think it should be there, turn it off for your own personal usage and tell your friends to send you plain text only. If you would like to actually read all the the e-mails you receive and not have to get on a soap-box because your chosen platform is in the dark ages, um... I mean enlightened to the truth about HTML in e-mails, then turn it on. Very simple. There. Problem solved.

> It's not because many people use it that it's good. I bet 95 % of these
> html-users doesn't even know they use it. It's just because their pc comes
> with a faulty installed mailer that html mails is so widly used.

And is not having HTML support in e-mail programs on the Atari going to solve that? We make up less than 1% of the computer-buying population of the world. We, for all intents and purposes, have no voice in the matter. If we stand up for an issue like this against everyone else instead of adapting the technology in some way to our systems for those who need it, that will only have the effect of further limiting our systems' usefulness. But that's what we've done all along, so it makes sense, I guess...

The mailer I use somewhat automates this. Preferences>Compose: "Reply to messages in the format in which they were sent".

Generally I use plain text and have the preference above deselected, but it's a logical option. However, I see nothing wrong in using HTML for e-mail requiring stylization like bulleted lists or citing. In its simplest form, HTML can be very handy.

I must admit, though, that when I used NEWsie, receiving HTML-based e-mails was a real pain -- I had to cut and paste the HTML into a file and have CAB view the contents. These days if I do send an HTML-based e-mail, there's always a plain text version along with it.

As for attachments in e-mail, I would much rather see HTML than Word or Rich Text Format.

So I can view html mail and not have to launch another app to view it.
The rendering engine in HighWire could be used to display the text
also.

Like it or not Martin, the PC world is making it very common for html
to be used in e-mail. M$ crap has html set as default. Just because
it wasn't done 20+ years ago when e-mail was created doesn't mean it's
wrong today. The net is not the old text based interface I used back
in the 80's.
Wake up.. it's not the 80's anymore!

> view the text with a browser.

That's fine, if you can do that. Not all of us have the luxury of time
it would take to reply to every HTML e-mail we receive. Here's an
admittedly extreme example...

You receive an e-mail in HTML, to which you would have to reply,
letting them know you don't like HTML e-mails. You then have to wait
for a reply, which might be a big "Huh? Why not?" or "You use what
kind of computer?" reply (maybe in HTML again) rather than the
original e-mail in plain text, to which you have to explain your
reasons, to which they'll balk at you for not using a PC anyway, etc.
etc. until you finally get the original e-mail. Meanwhile, so much
time has passed that the message itself might be a moot point anyway
if it's time-sensitive information.

That's if you're dealing with a person you know. If you are trying to
request information from a company that sends full HTML page spreads
demonstrating a product or something, they probably won't reformat
their information for you. If that's the case, then you have to cut
and paste the whole mess into CAB.

By the end of this, you simply give up and move to a Mac or PC for
e-mail because you're fed up with not having the ability to simply
read a stinking e-mail the first time it's sent.

Solution: Include HTML rendering ****as an option**** in an Atari
e-mail program. If you don't like it, don't use it, but don't limit
me from using it if I so choose because some people have a problem
with it.

Ok, so that's an extreme example, but that's very similar to what I had to deal with before I got my Mac (and I only got that out of necessity, and prefered MacOS to Windows). I still like the overall usefulness of e-mail programs on the Atari better, but this HTML thing is a real sticking point for me sometimes.

Like I said before, I don't use HTML except in extreme cases, and I don't advise using it. But since it is so prevalent, and it's not going away no matter how much we whine and complain about it, why not at least let us be able to view the stupid things when they come instead of going through all this fuss needed to simply read an e-mail? Especially for those of us with busy schedules, and time-sensitive e-mail needs?

Personally, I really don't understand people's need to completely trash and bash something they don't like, but *could* be useful to *some*, and could be included as an option they never even have to use, basically saying, "I don't like it, so no one else should have it."

> That's for my personal accounts, though. At work, there happen to arrive html
> e-mails, but there I'm using Mozilla. And that one has a preferences switch,
> that allows for setting the mail type (plain text or html) for any user in the
> address book.

By the way, until I got my Mac about 2 and a half years ago, I *only* owned an Atari (I've owned an Atari computer of one kind or another from 1984 until today), and I used that in my home business. I was very happy with it, barring the internet lackings it has. If I hadn't gotten another kind of computer, what would I do then, as far as business mailings? Should I complain about my client's e-mail habits, thus turning them off from my business? That's not a smart way of doing business. So I would then have to spend more time than I had just to simply open and read the e-mails. That's not good, either. What would you suggest then?

> Mytask 1.2. Mytask needs stic, but I'm having problems with stic.

I think you just put STIC in the START folder along with its RSC file.
You then can edit the RSC file to include the mini-icons you want to
use, and label them with the name of the program as it would appear in
the "control-alt-esc" task list. At least, that's how I got it to work
with Stewart. Come to think of it, do you know if STIC requires
Stewart to work? I don't think so, but I'm not 100% sure. I don't how
it works with MyTask, as I haven't tried them together.

Hope that helps!

No. The drive needs to be a Double-sided Double-density drive which are pretty difficult to find now (as they have been long superseded by High-Density drives).

The best ways to get a DS/DD drive would be from eBay either buy looking for an actual drive unit or even by buying an old 286/386 units that have the correct type of floppy drive. You may need to carry out the Drive B modification to the drive also.

There is another way to replace the floppy though. Fit a High-Density modification to the ST and fit a HD floppy drive. There are instructions available at the doit archive if you are feeling brave enough, or you could take it along to somewhere like Keychange.

Having a HD drive means it's a lot easier to share disks with PCs, if you ever wanted to.

Simon

I think he's meaning that PC drives are almost always High-Density
drives now, where as an ST needs a Double-Density drive unless you add a
HD modification to the floppy controller.

Hi!

IMHO mailer should be able to display just any content type that arrives.

So... make it componental and load Highwire as a component to your
window when there is no other choice. I just wonder how the hell you
would do that in any TOS compatible OS.

My vote: make the dynamic libraries a reality, create a componental
architecture, adopt already working architectures.

In any way 'don't allow HTML creation' still seems to be a good idea to me.

best regards

STan

Probably..... How many ST drives have you modified?

Keychange Music Services has supplied several hundred replacement DSDD
floppies over the last 10 yrs.

Mostly modified Sony mechs.

Still available.

Simply changing the drive select will not produce an ST compatible DSDD
drive.

www.keychange.co.uk

No, www.keychange.co.uk can supply genuine Atari or modified DSDD drives.

> Fit a High-Density modification to the ST and fit a HD floppy drive.

Except that unless you have a second HD machine, if your ST dies you can't
access your data 'till you get it fixed.

I suppose it depends on whether you want anyone to reply to your postings or not.

To most right-minded people top-posting is a sign of laziness. It leads to excessive quoting and makes it very difficult to see what point from the posting is being referred to.

It's been a long time since I changed the floppy in an ST, but it's my
recollection that all I had to do was jumper across the HD-detect switch to
disable it? Hallvard Tangeraas had/has a useful guide to all this on his web
site.

I'm a mint newborn. I need lotsa help in setting up Falcon with mint.

I need to know:

1) What are the basic files I need.

2) What extras do you recommed.

3) Will adding an AB040 and Eclipse to my Falcon screw up the mint os.

4) And anything else anyone may want to add.

Thanks in advance to all,

Hi Martin,

>Anyway, I'm glad to hear Troll doesn't work for you too. On my system I
>can't get Troll pass the authentication.

I managed to get it working under IConnect using the IFusion STIK/STiNG
emulator, authentication is then handled by IConnect which is rather good
at doing just that.

>Hm, Newsie is not my thing. For some reason I never loved it. In the
>past I tried to used it but ... no love at all.

Welcome in the club, I never liked it either --- it screwed up my boot
partition once and that's the last time I looked at it --- crap like that
shouldn't be even hosted on servers.... and IIRC my boot partition going
to the dogs wasn't really a one off, a lot of "would-be" Newsie users
experienced the same thing.

>My favourite newsreader is Okami. Unfortunately the developement of
>Okami seems to be stopped.

It had to happen once.... but then the programmer left a nice program as
legacy, it'll take many light years before Troll plays in the same league
as Okami and ASH Emailer. As for Newsie... IMO instead of dreaming out
loud of improving it, they should burn the source code.

Cheers from Belgium
Dennis

SF0218 wrote:

> I'm a mint newborn. I need lotsa help in setting up Falcon with mint.

Sure, glad to help, its not exactly easiest install procedure around :)

> 1) What are the basic files I need.

Depends. As said many times, MiNT comes in 2 flavors mainly:

MultiTOS like setup: FreeMiNT kernel + one of AES-es (XaAES or N.AES) and desktop application (Thing or Jinnee). This setup offers multiasking desktop and aprox same usability as Magic, but it is a tad more heavy on CPU and use more resources (RAM). Benefits are possibility of use some MiNT drivers and external loadable devices... So for such setup basic files are:

FreeMiNT kernel, AES and Desktop.

MiNT OS setup: This is full Unix clone. It offers Unix envoirment and GEM multitasking desktop at same time. GEM apps also can use Unix resources (drivers etc, internet acces, bla bla). Best part is as said Unix/GEM merging. Its a lot more heavy on resources (RAM and HDD space) and also it is mandatory to convert atleast one partiton to EXT2 partition. U need:

Atleast 500Mb free space on HDD (i know thats more as specified, but its stupid to pack Unix OS on hdd, and then use only GEM and TOS filesystem. So if u plan to use Unix as well, u need place for HOME dir, new apps, etc..) Then u need to download EasyMiNT package and correspondent "paketes", atleast basic, standard and network. I advice u get all, except maybe X11. Docs in EasyMiNT arent so bad, but if u get stuck, im here...

> 2) What extras do you recommed.

All :)

> 3) Will adding an AB040 and Eclipse to my Falcon screw up the mint os.

No. Also, Atarians have boot managers quite a lot of time, so u can install let say MiNT Os and Magic. And on boot u will decide if u will boot into TOS (or some of its variant), MiNT Os, MultiTOS or Magic.. No flaws whatsoever.

> 4) And anything else anyone may want to add.
> C-Lab Falcon, 14mbram,540mb hdd.,

14MB may be tight, especialy for MiNT OS! Honestly i think u need to wait AB040 (why not CT60 btw?) and more RAM. U may install it now, but i guess ull be left with some 6mb free after boot. More if u wont load AES, but i doubt u will work in CLI alone. U can do that in Linux, Ataris should run

GEM :)

Janez

>can't display it !)

Okami is a mailer/newsreader that's compliant with all mail and news RFC
rules, there's nothing to understand about it really, those embedded HTML
mails break and are against the RFC rules, it's as simple as that...
A mailer/newsreader doesn't have to be able to dicipher that non-standard
rubbish, the programmer of Okami went through great lengths making sure
that his program conforms to the rules. Just because some money hungry
corporation which defies all standards and likes to set its own standards
(shove it up the users their ****) doesn't mean we have to drop our pants
as well and bend.... It's not only on this platform that people don't
like dropping their pants and bend over, you would be surprised how many
popular mailers/newsreaders on the PC and Mac platforms don't display that
rubbish either --- note that I wrote "don't" not "can't" :-)

>This brings me to my "wish list" for any modifications that might get
>done to Newsie.

>I hope someone will be able to do a Newsie upgrade (sorry - I can't
>programme anything more complicated than a VCR !), and look forward to
>seeing it one day.

Once again we have conflicting views... ;-)
Let's be realistic, what you and some other people here really expect is
not a measly Newsie upgrade, but a complete new written from scratch app.

Presuming there is a talented programmer hiding under a rock somewhere,
willing to take a "look" at the sources, IMO he would better start from
scratch... there's no need for yet another ftp and mailer, we got heaps
of those, and a couple of them are excellent. Some people here obviously
need/want a better newsreader, well there's good news: the beta version
of Troll has just been released, keep in mind that it's a beta and its
early days yet. But the potential is there....

BTW: what is going on here?
Instead of being happy that a new program which looks quite promising is

released for this platform (a rare occasion), you guys all start making noise about a bug ridden abandoned piece of crap...
And yes I realise Troll is in French and some of us can't make head nor tails from that language, but no worries, before the week is over you'll find the English translation on the DDP website.
For god sake, if all of you wanna see this platform survive just a little longer, then start support the people that actually *DO* something about it, instead of dancing on the tunes of the dreamers their music....

Cheers from Belgium
Dennis

Of course they are, else you wouldnt be piping up.

> Simply changing the drive select will not produce an ST compatible DSDD
> drive.

There is no such thing. PC drives are the same as ST drives. Except for the
drive 0/1 issue, and maybe a faceplate change (not an issue on the falcon).

Isn't there the issue of PC drives not working 100% on the ST because of the Media Detect problem? ie if you have a disk window open and remove disk then insert another disk and do not refresh dir (by hitting ESC) you will corrup that disk.

Tim

It might be that your news server doesn't keep a large archive of previous posts, deleting them in order of age, let's say, after two months or so. The limit of each newsgroup, depending on how much traffic it gets, will vary too.

As for all the current posts, again it might be your news server. Why not try a commercial service? I use NewsGuy (http://newsguy.com/). Cost is about 11 cents a day for a basic account. For comp.sys.atari.st they have about 2500 previous posts, but the important thing is that their feeds are reliable and comprehensive. Configuration is easy: just add their NNTP host and your username and password.

As for the corruption problem (which I experienced), only a rewrite of NEWSie will cure that.

And here if I like!

If you want to be correct about it Derryck, I was actually posting a
new topic and should have created a new thread.

My comment was to the thread subject and asking a new question. So
posting above was fine seeing the rest didn't matter tot he content.

Just because you are a lazy anal putz to follow the complete thread is
your issue. Don't like it.. skip the message! IT'S THAT SIMPLE! Or is
that too much for you to handle? You and Martin are not the ones in
charge of the usenet, so stop bitching if you don't like a way someone
post a message.

I agree,

I think newsie is the perfect platform to launch a great threaded
newsreader with features that current users demand. Sure there may not be
many people to do it, but someone will.

As "dreaded" as newsie is, there's a reason most people use it. For
what's out there, it's relatively the best. Troll looks extremely
promising but just isn't ready, and Okami is pretty much a pain in the
rear to setup (I never got it working 100% and I'm a sysadmin), not to
mention okami costs money and has no perceivable (in my eyes) advantages
to newsie. Troll has news threads which if newsie doesn't get
improvements before Troll is ready for primetime, the author of troll will
be receiving the shareware fee from me. Otherwise, unfortunately he may
not.

Regardless, open source applications are GOOD! what if we move to powerpc
some day? Every piece of source code we have becomes worth it's weight in
gold, as it's another application that can be RAN instead of EMULATED.
It's a pipedream to think motorola will stick with the coldfire forever
and that it will always be useable to us. Already look at the challenges
and this is the M68k successor!

Nobody can predict the future, so keeping our options open is of paramount
importance. Commercial software, free software, shareware software, 68k
hardware and powerpc hardware for us all have their place, and each effort
should be embraced, just as both freemint AND MagiC should be embraced.
The only thing that should not be embraced however are multiple open
source/free solutions to the same problem, like MyAES AND XaAES... HUH?
;-) WORK ON THE SAME ONE TOGETHER - YOU BOTH HAVE GOOD IDEAS!

The way I see it, it likely wouldn't be all THAT hard to create a stripped down freemint kernel that works on top of the MagiC kernel to give all of the kernel functions that would allow a working "MagiClib". The proof is in the pudding - MagiCNet. Look at how much of a success that was. If such a thing were to come, the huge advantages of running freemint would soon wither away to the raw speed of MagiC's AES and magxdesk desktop. Users who prefer MagiC could more or less stay in the same region of operation as FreeMiNT users - right now we are talking drastically different operating platforms.

Or a decent ISP will give you a good news service already. ISP is the
whole package, don't pay money for crap. Speakeasy gives me easynews (I
tthink that's what it is anyway), and they archive some 4000-5000 articles
IIRC. Anyway, my newsreader currently has something like 11000 articles
stored so it's a moot point. The news reader should keep it's own proper
archive of articles, assuming you have disk space for such an adventure.

Top posting.

I am getting confused. For a quite long time now, the difference between a floppy drive that does 9 sectors, 18 sectors, or 36 sectors has been determined by whether its clock signal is 8 MHz, 16 MHz, or 32 Mhz.

In fact, I believe that this situation started on about day one of 3.5 inch floppy drives. If this is not what is being disussed, will somebody please tell me what the topic is?

2333. Re: Replacement ST/STE Floppy - Media Detect?

Newsgroup: comp.sys.atari.st
Date: 2004-03-30 01:27:01 UTC
From: David Bolt <blacklist-me@davjam.org>
Message-ID: <w4DPMyMlzMaAFwPc@my-ste.davjam.org>
Source record: 19622

On Mon, 29 Mar 2004, Tim <tjlazer@nospam.mail.com> wrote:-

>Isn't there the issue of PC drives not working 100% on the ST because of the
>Media Detect problem? ie if you have a disk window open and remove disk
>then insert another disk and do not refresh dir (by hitting ESC) you will
>corrup that disk.

To make a high density floppy drive compatible with an ST, there are
only 2 modifications required:

One is to swap the drive select jumper, or make a solder bridge between
the DS0 pads while breaking the bridge between the DS1 pads;

The other is to bridge the media detect switch so it appears to the
drive that there is always a disc in the drive[0].

These 2 modifications will make any generic, off-the-shelf, high density
floppy drive work with an ST, and probably a Falcon. I know this works
with an ST, since I've replaced several floppies in STs, and have
thoroughly tested them out after replacement so know that none have had
to be repaired afterwards.

[0] IIRC, all the drives I have done this to, with the last one a few
years ago just before my previous STE died, had the media detect switch
next to the write protect switch[1]. This is just one more reason to
test the drives after modification and before final fitting.

[1] Yes, the first time I did this modification, I got bit by not
testing it worked correctly before final fitting. Luckily, the disc was
one I kept write-protected most of the time, had forgotten to
write-enable before inserting it in the drive, and successfully wrote to
it. Upon removing the disc to write-protect it, I noticed it was already
write protected so performed an immediate shut down and corrected the
mistake. Since that one time, I never made that mistake again.

I've had bad luck with my previous ISPs' news servers. Decent companies in all other respects. I complained, too, but it had little affect. One provider -- one of the largest in Canada -- even shut down their news server altogether, and that's when I went to NewsGuy. It wasn't worth it to change my e-mail address and URLs for the sake of a news server.

John may be happy with his current ISP, but it sounds like their news feeds are lacking like mine were. And who's to say whether his next ISP will be any better (unless he makes inquiries beforehand). Paying an extra 11 cents (or less) per day for dedicated, almost spam-free, news feeds isn't going to hurt too much.

At one time I had about 10,000 articles from comp.sys.atari.st in MacSOUP's database. Right now there are about 3,000 -- four months worth.

Dennis,

If someone post an opinion on what they would like to see
happen to Newsie for improvements, why are they dreaming? That's being
negative, it's good to get peoples opinions on the subject, To see
what other people think.

On burning the source.. what the hell.. burn the source, it only took
ME about a year to get the source from John.

While USENET isn't the best place for it. It needs to be done.
We still have alot of programmers around, working on this or working on
that. Sometimes they feel like a change and to work on something else
for awhile. Generally the bugs that will get fixed are the ones that
affect
them personally, but if there is a list of things people have problems with
or
things they would like to see done maybe a few of these will get picked up.

One programmers nightmare bug from hell is another programmers 30 second
fix!

Personally I'm of the belief that choice is always good.

David Bolt explains the situation below, however for a falcon you can leave the media detect alone (and should). I never bothered with the media detect fix on my STe, I always hit escape whenever changing disks out of (good) habit, and I also leave them write protected until absolutely neccessary.

2343. [UTD] April Release of Eureka

Newsgroup: comp.sys.atari.st
Date: 2004-03-31 09:44:15 UTC
From: Francois LE COAT <lecoat@atari.org>
Message-ID: <c4e3tf$jb3$2@news-reader4.wanadoo.fr>
Source record: 19632

Hi,

The software "Eureka" is updated and released on its WEB page.
It is a "2D Graph Describer and 3D Modeller". It is updated
nearly every month, if I found significant improvements for it.
You will have to fetch it at :

http://eureka.atari.org/eurka404.zip
That is the Complete Common Edition

http://eureka.atari.org/eurka020.zip
Is the Complete 68020 Edition

http://eureka.atari.org/eurkafpu.zip
Is the Limited FPU Edition

http://eureka.atari.org/eurklite.zip
Is the Lite Edition, working on early ST with 720kb floppy

http://eureka.atari.org/lib_dgem.zip
Are Dynamic Libraries Extensions for Eureka

http://eureka.atari.org/tiny045.zip
Is the OpenGL Extension (requires previous package)

It's two months since there hasn't been any release of Eureka.
In facts, my Hades 60 caused me some troubles that are fixed
now. You may understand though that there's a late, and a few
related novelties to be published. That's it ...

I wish you big fun with all this new STuff !

Best regards,

-- Franï¿½ois LE COAT
Author of Eureka 2.12
http://eureka.atari.org

2344. Re: TT030 memory upgrade

No, I have not, but that has never stopped anyone else.

You might check the number of chips on those 4 meg simms. It may be that
three-chip simm will not work, and four-chip will.

If all else fails, I have one of those TT-RAM boards, and have no need for
it, and am willing to send it, for the cost of packaging and postage, to
any place in the world. Yes, I paid for it, but it needs a better home.

Jim

Claude Bourgoin <claude@pivot.net> writes:

2346. ATARI (Infogrames) will produce a new ST

Newsgroup: comp.sys.atari.st
Date: 2004-04-01 10:28:48 UTC
From: plartorill@yahoo.ca
Message-ID: <bd394b8d.0404010228.28d3d62a@posting.google.com>
Source record: 19635

especially fr musicians.The ATARI ST was in high demand for years in music business, but today more and more STs are dying and almost no software is developed any more.

So Infogrames decided to release a new ATARI ST especially for musicians, with the best music software already on board, in form of ROM chips.

The new ST will also feature MIDI access, a lighter and smaller ST board and will be released as classic ST or in notebook form.The computer will use PPC+68K CPUs.

The new ST will be released this fall for $199.

Aw crapola, I am after a ram card of any kind. My poor beast only has 2meg
ST ram, and no TT ram. If Mr Bourgoin is not needing it, I would be happy to
pay you any (reasonable), amount for it. Nothing on evil bay ATM :-(.

Just a note too, 4 chip simms are usually just 3 chip plus parity. The
parity bit (or bit 9) is not used, so I doubt that would make a difference.
Could be a duff chip.

Mark

2352. MiNT for Pegasos?

Newsgroup: comp.sys.atari.st
Date: 2004-04-01 11:14:33 UTC
From: Sylwek <sylwekWYKASUJTO@pf.pl>
Message-ID: <sylwekWYKASUJTO-994B8F.13143301042004@gw1.news.tpi.pl>
Source record: 19637

Hi all,
after a long time without Atari I bought TT - despite its age still quite nice machnine :-) I was searching for various Atari-related information to see what happened in last years and found interesting Atari Coldfire project. And I started to wonder - couldn't we just used ready hardware? Why not port FreeMiNT to Pegasos Power PC G3 or G4 boards??? They are relatively cheap (400-700$ depending on the CPU - compare it to rumoured 1000$ for Coldfire - and fastest coldfire processor is 6x slower than G4/1GHz PPC used in Pegasos...), are widely available (even in Poland ;-) and uses all modern technologies you could imagine (USB 2.0, gigabit ethernet, Firewire, DDR-RAM). Right now they run MorphOS - a kind of AmigaOS clone, running native Amiga applications at 68k emulation (faster than 68060/50...) and LinuxPPC. Serious Atari programmers could join together and ask Genesi if they could rewrite FreeMiNT for Pegasos - after all they could then sell more boards - making it more profitable. Right now the newest MorphOS 1.4 uses very fast JIT 68k emulation, so even on G3/800 old programs run faster than on 68060/50...
Wouldn't that be incredible and fun? One hardware platform, that could run both - Atari and Amiga software :-)
More about Pegasos and accompanying systems you can find here:
www.pegasosppc.com

It is what I proposed a long time ago !
And now some developers (french) are working on a such project for TOS !
My AES, a new AES is running and a new VDI may be written after.
Like this we get sources abd can adapt on the hardware we want to use...
May be CF or PPC.

They are relatively cheap (400-700$ depending on the CPU

Yes, that's a good point we should try to use...

, so even on

I love you Rodolph :-) Keep us informed.

> Yes, that's a good point we should try to use...
I think Pegasos is the cheapest PPC board right now. It gets more and
more attention and many Amiga users already switched to this just
because it is two times cheaper than Amiga ONE, not to mention, that
AmigaOS 4 is still not ready, while MorphOS is now quite mature
product...

2358. HELP- With Atari Mega ST

Newsgroup: comp.sys.atari.st
Date: 2004-04-01 15:43:38 UTC
From: Brandon Alexander <composer.22@att.net>
Message-ID: <l0do60h56k0hcqnqkem1793uo7sek8s98v@4ax.com>
Source record: 19547

I am not able to access the hard drive on my Mega ST. However the machine will boot up with regular TOS disks and behave much like an ST-1040.

This started a while back. If I remember correctly there are certain boot programs it needs to boot. What I did was erase or rename those programs because I could not get GDOS programs to run. Once I did I could not get the hard drive back. It's there and purring but again will not boot, and does not show up on the desktop.

At any rate if somebody knows how I can access the hard disk please advise.

Thanks.

Al.

Al,

Dig out the "Atari Hard Disk Utilities" floppy that came with your computer.
You'll find the AHDI and HDX programs necessary to boot your hard disk and
reinstall whatever you deleted.

Thanks for the information.

Appreciate the suggestion but I don't have any of the disk utilities.
I bought this computer 2nd-hand. All that came with it was a Cubase
disk.

If you have those utilities I would like to have copies.

Thanks,

Al.

2363. AHDI and HDX programs for Mega STE

Newsgroup: comp.sys.atari.st
Date: 2004-04-01 19:32:43 UTC

Yes : only 8 or 9 chips modules will run on to this board, though
I don't remember if it must be EDO or FPM.
A google search across the french NG will bring you to a thread I
started 1+ year ago, in which I think you might find useful infos.
You might do a search in this NG too, as I think the subject has
been discussed more than once ;-)

Yes do a search for AHDX on the net and you will find sites that have this for download. Then copy or unzip the files to a 720kb disk and run it on the Mega ST.

>old apps.

Hallelujah!!! The messiah has spoken....

It might have escaped your attention but those people living under a rock
with their pile of old apps happen to be *real* Atari users, and they have
no alternative --- no one of the dreamers managed to port a mailer over
yet that can handle embedded html.

>Those that want to live in the 80's wish to force it on the rest
>it seems. If someone don't like the idea of html in mail, then don't use
>it. Really simple actually.

Yes it certainly is, especially if you consider that they can't even use
it, because it's not available. How can one force something on one that
doesn't exist?

>I get so much mail like that anymore I am forced to use the mac for e-
>mail and it's not just people, it's online

And you blame us for a general flaw in thinking? If everyone here would
adopt your way of thinking there wouldn't be a Atari platform anymore.
let's all move over to the Mac!
Would you tell us for what purpose you still actively use your Hades,
since you obviously don't like using a pile of old apps I presume
you use the Hades as a doorstop? Or is that also a flaw in thinking?

BTW: did your mac mailer/newsreader filter managed to stop this posting?
Just an example of how effective filters are. Another flaw in thinking
perhaps? LOL

>thread. A lot of time and effort went into newsie and I suggest anyone who
>wishes to burn the source, should sit down and try to code a mail
>application. No one forced anyone to use it in the first place either.

How many light years ago did the author bothered to actually upgrade/fix or
even improve that piece of shit? I do know one thing: a lot of posters here
have tried to get in touch with him and asked -- no -- let's make that
pleaded - for a more stable Newsie.

And no, no one forced me to use that piece of crap, and that's the whole
point... I happen to use an ATARI mailer/newsreader that hasn't got the
problems Newsie has. Put in different words: there's choice !! I don't
really recall many postings here of people having a problem with ASH Emailer
or Okami... do you?
Newsie was great in the early days, when nothing else/better was available,
in the meantime we moved on, and Newsie and his author stayed put, not even
moving an inch. EVERY Newsie user should reflect on this, no one is forcing
them to use a different app, but it's about time they realise that there are
a couple of excellent alternatives available. And they don't need to buy/use
a Mac to achieve it.

Cheers from Belgium
Dennis

>Dennis,
>If someone post an opinion on what they would like to see happen to Newsie
>for improvements, why are they dreaming? That's being negative, it's good
>to get peoples opinions on the subject, To see what other people think.

Well, we all know now what other people think; they wanna see it evolve into
a mailer that can handle embedded html....
This thread has generated a lot of posts, but let's face it, so far no one
has come forward announcing he/she would maintain the code. As far as I am
concerned all these posters live in coockoo land... having a wish list is
one thing, getting it fullfilled is another one. And no, there's nothing
negative about people airing what kind of newsreader/mailer they would love
to see on this platform.... but it's like dreaming out loud.
Let's face the facts, even if someone would come forward announcing he/she
would maintain/upgrade the code, what do you expect? In the best scenario
the bugs will be weeded out. But one doesn't need to be a programmer to
realise that the Newsie code is not suitable at all to implement the stuff
people here have put on their list.

>On burning the source.. what the hell.. burn the source, it only took
>ME about a year to get the source from John.

Ah, well, then you wasted a lot of valuable time...
Personally, I am convinced that the Newsie source code will end up the same
way as the code for QED, PixArt, Cypress, Imagine, Smurf, Interface, Chagall
etc, put in other words *no where*. The status of these app has changed,
but's that it, in practice however they're just as dead as they've been for
zilch years.

IMO we should support the authors who are currently supporting this platform
actively --- and yes I know it's only a handfull but what's the alternative ?
Open source?... LOL
Personally I put my money on the shareware/freeware/commercial developers --
they don't make any noise here but deliver the goods. And anyone wanting a
mailer which can handle embedded html, should get in touch with the author of
MyMail -- the only mailer left that is still actively developed. That's being
realistic... if you open your eyes and think about it for a minute, you'll
soon realise that this is the only option.

How's that for being negative?

Cheers from Belgium
Dennis

>personally, but if there is a list of things people have problems with
>or things they would like to see done maybe a few of these will get
>picked up.

Sure... but we're talking about Newsie here! "picking" up a few bugs or
flaws just isn't good enough. And what kind of programmer would add new
features to it, knowing that the existing flaws aren't fixed?

>Personally I'm of the belief that choice is always good.

Yes I agree, and in this particular case there is choice. If there's one
thing we have plenty on this platform its mailers and other clients, and
if I understood it correctly, the WenSuite code soon will be open source
as well.
Anyone here remembers WenSuite? Another app with a lot of things to "pick
up" on, but compared to Newsie it should be quite obvious that this *IS*
the candidate to be "improved".

Hi Mark,

>As "dreaded" as newsie is, there's a reason most people use it. For
>what's out there, it's relatively the best.

Would you please define "most"? From where I am sitting I can only see a handfull of users. I presume users on low memory machines running under SingleTOS.

>Troll looks extremely promising but just isn't ready, and Okami is
>pretty much a pain in the rear to setup (I never got it working 100% and
>I'm a sysadmin), not to mention okami costs money and has no perceivable
>(in my eyes) advantages to newsie.

Ah!!! the cat is out the bag.
Like always, you climb on your soapbox and yell: "if it's not free let's bash it". I'm not going to comment on a sysadmin who can't even manage to get Okami 100% working, but the perceivable advantage to using Okami or ASH Emailer is peace of mind... that's what you get for your money.
ASH Emailer has an even worser status then Okami: it's *commercial*, how many people can claim that after seven years of usage, they never lost one single thread? Would you care to look up the posts in Google about all the unfortunate Newsie users that paraded here? I wouldn't wanna feed them!

>Regardless, open source applications are GOOD! what if we move to
>powerpc some day? Every piece of source code we have becomes worth it's
>weight in gold, as it's another application that can be RAN instead of
>EMULATED.
>
The longer this thread runs, the more nonsense....
Please give me *one* example, of an open source application which is used by the *majority* of the users... yep, that's how good the apps are. And before some of my other "friends" come crawling out the woodwork, I don't have anything against open source software, but the simple fact is that on *this* platform it doesn't work. In a different post I mentioned some of the apps that have now the open source status and they're laying there gathering dust... I fail to see what is so good about that. That handfull of programmers that's left on this platform has no time - occupied with different projects - don't give a damn. And that Mark is the reality. And about moving to PowerPC.... dream on.

>The way I see it, it likely wouldn't be all THAT hard to create a
>stripped down freemint kernel that works on top of the MagiC kernel to
>give all of the kernel functions that would allow a working "MagiClib".
>The proof is in the pudding - MagiCNet.

IIRC MagiCNet "was" a dirty third party hack... glad to hear that it all
of a sudden has a better status.

>Look at how much of a success that was.

Have you asked yourself why it's such a success? Let's face it, who uses
MagiCNet? And why do these people settle for "second best"?

>Users who prefer MagiC could more or less stay in the same region of
>operation as FreeMiNT users - right now we are talking drastically

Yes, study the code ;)

Hi Dennis :)

I agree with you about that NEWSie is too buggy to maintain and
upgrade by another programmer. It's better and easier to code
something new on clean basis, and newsreader only (better mail,
ftp and web applications already exists).

I will delete the NEWSIE.PRG on my harddisk with satisfaction, but
never burn the source code: it's a sacred thing. And the fact
NEWSie's author gave his own sources to the atarian community is
the most noble act he can do.

So I will study the code, to go quicker in Troll development, to
avoid NEWSie errors, to see how I can manage this or that
functionality. To study is to learn, not to copy ;)

Other subject:

Thanks the English translation. I have not time to translaste
myself. I thought to do it only when Troll have the 'post'
functionnality, but your help is welcomed :)
I'm about to release a 'beta2' (just bugfixes) this night or week-end,
but the RSC has not changed except the date and version in the info
window.

Best regards

I don't know why lp decided to killfile me when it wasn't me that was
trolling, but I really couldn't care less TBH.

To get right back onto the NEWSie thread, killfile capabilities are
definitely needed for any new version.

First of all, I've nothing against Newsie whatsoever. For some people
Newsie is the max. I however don't like it at all. Why? I don't know.
Surely not because it's crap like a fellow-countryman claims.

Quite some years ago the ISP I was using at that time dropped the support
of NewNews. Retrieving articles was only possible by article number. As
the reader is was using at that time, Oasis, didn't support "retrieval by
article number" I was forced to use an alternative. As the successor of
Oasis (I can't remember the name) was just one big bug the only
alternative I had was Newsie. During the periode I used Newsie I
encountered a few disk problem (faulty sectors) caused by the cache but
nothing serious. Newsie did what I had to do.
However a few months later I discovered Popwatch, Newswatch and Okami. I
must say I felt in love with Okami. For me Okami is the max.

The best??? Hm, I'm not quite sure of that. Newsie as it is today
contains many shortcomings. One of then is the lack of text encoding.
Mails written in French for instance will look awfull when read with a
non-Atari newsreader.

>Troll looks extremely
>promising but just isn't ready, and Okami is pretty much a pain in the

>improvements before Troll is ready for primetime, the author of troll will
>be receiving the shareware fee from me. Otherwise, unfortunately he may
>not.

AFAIK, there will be a newer test version of Troll today which will work
with gluestik/MiNT.
As for Okami, you're probably talking about a old Okami versie which was
indeed rather difficult to set up, but he, even I managed to get it
working so a sysadmin should be able to set it up too. :-)
Anyway the latest release (3.0B-11) of Okami is much easier to set up.
Still not fools proof though. It requires still some readings.

If more people would use it I'm sure the programmer would implement new
things like UTF 8 encoding.

I would goto the HDDriver website and download the demo version.
Run it and see if that helps. I'll bet it will. Then just buy a
full version and you will be all set.

>

From what I can tell so far the general consensus of people seems to follow
this outline for Newsie.

Dump current file handling routines and replace with something that isn't
as buggy.

Dump display routines and replace with Highwire display engine.
(I know this is controversial but follow my logic here)
People want multiple encodings, the Highwire engine gives
this with out extra work. This would also give a common base for
bug fixes and add a host of new features in and of itself to Newsie.

Kill File support.

Option to sort threads by different criteria.

There were probably some other things floating around that I missed.
But I don't think it's impossible to fix.

Another option would be to harvest the NNTP routines out of Newsie
and make them an extended module for Highwire.

That's just a few ideas there. It all comes down to what people need.
A programmer writes code for usually one of three reasons.
1. They are getting paid to do it.
2. The need to have it for their own use.
3. The really feel like doing it.

We usually see number 2 or number 3 on our platform. Number 1 hasn't
been there for a decade or more realistically.

> >Personally I'm of the belief that choice is always good.
>
> Yes I agree, and in this particular case there is choice. If there's one
> thing we have plenty on this platform its mailers and other clients, and

We do have several mailers for our platform. I wrote one myself years
ago. Although I don't know if I should remind anyone of that. However
if we are still around in another 10 years I imagine we will have a few
more pop up. As to ftp programs, we have several, however I would
contend at best they do the job. For web browsing of course we always
have Highwire, but I'm a bit biased there.

For news clients we have always been a bit limited. It looks like Troll
might be a killer app to come in and fill this hole. However as I said
above, I always like the idea of choice. As we have seen in this thread
some people like mailer a, others like mailer b. And being normal
atari users we can't discuss the topic without it devolving into a flame war
;)

> if I understood it correctly, the WenSuite code soon will be open source
> as well.
> Anyone here remembers WenSuite? Another app with a lot of things to "pick
> up" on, but compared to Newsie it should be quite obvious that this *IS*
> the candidate to be "improved".

I personally was never impressed by WenSuite. To be honest I never had more
than their demo version, but it didn't inspire me to want to purchase it.
At best
for me it was always flakey. It's also been rumoured to be going open
source
for several years now. If it goes open source, I'll look at the code. I'm
quite
addicted to reading source code.

2388. [ANN] Troll beta 2

Newsgroup: comp.sys.atari.st
Date: 2004-04-02 20:10:12 UTC
From: ptonthatNO@SPAMclub-internet.fr
Message-ID: <406dc8a3$0$292$7a628cd7@news.club-internet.fr>
Source record: 19577

Bonsoir :)

A bugfix is released on my homepage, or directly at
http://rajah.atari.org/files/ -> trollb2_fr.zip (100 Kb)

Sorry for the French only version. No time to translate yet.

Fixes:
- works now correcly with Gluestik (tests with MagiCNet), assumes
it's also working with STiK2 (Thanks Jean-Marc Jean-Luc et Cyril)
+ speeder with server NNTP receive.
- message window is top-able if mouse click in the text
- GMT date correction (was bad is month change)
- added newsgroups are now always blank (could find some old
titles from deleted newsgroups)
- Mxalloc flags corrected (Thanks Lonny. For MiNT MP compatibility,
you must recompile the GFA source with the GFA library compatile
with MiNT)

If you have redraw problems with forums names or titles, you should
desactivate the icon display. It's a bug from your AES (works
correctly with TOS, MultiTOS and MagiC).

If RAM isn't a issue go for Thing. If you're short of RAM go for Jinnee
or Terradesk.
Personaly I use Thing. I do have Jinnee too but I hardly use it as I
don't like.
The only desktop which is still maintained is Terradesk though and it's
for free.

Ok, it seesm to work with gluestik/freeMiNT 1.15.12/N_AES.
The only problem I've right now is that Troll can't find back its cfg.
Troll keep asking me to set the path of the work and cache dir. Troll
save its cfg to my home dir though (on a ext2fs partition).

I'm only using Tos2.6 on an Atari Ste at 4mb and that is my problem. The program just bombs out or just freezes. I've accepted that it needs a multitasking environment to run properly and that I just don't have nor do I fel a need for it.
Thanks for asking.

To me it wasn't a waste of time, I believe in the idea of TOPP. If we
have the code then we still have a 'chance' of it being worked on. If
the platform moves to ColdFire or PPC, then the code could be compiled
to run native and not emulated.

But if the code helps Pierre with Troll, then it's worth the time.

>
> IMO we should support the authors who are currently supporting this platform
> actively --- and yes I know it's only a handfull but what's the alternative ?

YES, we should support who is left. Without them, the platform will
die.

> Open source?... LOL
Well, Open Source is good. If we can take code from other platforms
and use it, then the few coders we have left can work on more
projects. It also good to use for a guide to learn.

Rob

The problem is known and there's a work-around that should normaly
work: it writes a test file in the home to see if it's possible to
use the home dir.
If you have not the CFG file, run Troll in TOS or MagiC mode,
set the preferences and save them.
Then put the TROLL.CFG besides the TROLL.PRG.
The program takes first the CFG besides itself. If not found, it
searches in the $HOME folder.

One thing: did you create the WORK and CACHE folders?
You'll have always this alert if these do not exist.

As said in the ST-Guide doc (notyet English, sorry),
I prefer the user to create them 'a mano'. For security reasons,
these folders should be placed on a partition that serves for
internet cache and/or temporary files. This partition should not
contain critical datas and could be erased (zero-ized) without
regrets.

This to avoid bad sectors or file corruptions on important partitions.
If you download plenty of small files on your hard disk, your system
may not support it (depends on your OS and its file-managment).

So it's advised to:
- if xDSL connexion: do not use the CACHE and download always the messages
(it's very fast now, even with a 128Kbits connection I have at home)
- or use the cache and delete its contents every time you quit the
Troll.

'Principe de precaution' (as we say in France). Be carefull will all
that is unverified. Troll is new so use the same attention you had
with NEWSie.

Regards

Pierre

I believe that Newsie is not compatible with my news server but that's a guess since I don't use other news readers! One day my post will be seen and the next day it's gone (plus there;s times when I'm told that a replt was posted but it's not seen here. There are those that suggest using Okami but I never could get it set up (be would be nice if it had an installation program).

I think you're right. It's also far in my mind for me too :)
This one (Oasis 2) was very promising at the time but was never
completely debuged/finished. It was intended to have a web browser
(Spider), never released. IIRC, the editor/reader part was not bad.

Bye,
/Pascal/

I've recently found out (by experimentation) how to use an internal amiga floppy drive with an st/ste (without any mod's), however I remember years ago being told that it is possible to modify an amiga mouse (official cbm or 3rd party) for use with an ST/STE, does this hold true, if so can someone show me how it's done

2404. Tim: AHDI and HDX programs for Mega STE

>
>Tim

Thanks, Tim.

That worked once. On my hard disk I had renamed CONTROL.ACC. I
accessed the Hard Disk and re-renamed it, then tried to boot it. It
did not, so there must be something else I renamed. Unfortunately I
did not make ST hard copies of AHDI.PRG and HXD.PRG (or any of the
other files)

I tried the process again, copying the files from PC to ST. His time
when I ran the AHDI I got TOS error #35.

I think the problem is, now I can't find any 720 disk that will work
on my PC without creating writing errors.

Do you have any suggestions about interchanging floppies between the
ST and a PC? Like which machine to format the disk on, etc. It seems
when I format on ST the PC can't read-when I format on PC the ST can't
read. If you have any suggestions or tips they would be appreciated.

Thanks,

Al.

Did you try it under MagiC! ?
On both my FalCT60□ and TT030, it only works in monochrom - more exactly, whatever the resolution I select, it only displays 640x480x2 (or, if I use VI, 1024x768x2).

Yes, but only because I did a google search for it. You learn much faster by
looking yourself.
Usually its due to a disk read error

This doesn't work. Troll does create TROLL.CFG in the $HOME folder.

root@hades060/home/root>ll |grep TROLL.CFG
-rw-rw-rw- 1 root wheel 2197 Apr 3 20:45 TROLL.CFG

I've tried it to place it next to troll.prg but alas ... still no joy.
For your information I'm using freeMiNT 1.15.12, N_AES 2.0.0, Thing 1.27.
The partition were Troll is located is a VFAT one. $HOME is located on an
ext2fs.

HTH,
Martin

The reader/editor on itself was pretty good indeed. Only the dial in program was very bad. I never managed to get that thing working. At the beginning the programmers were co-operative (I was one of the few registrated users) but soon they stopped answering my mails and finally they dropped Oasis 2. It's a pity, Oasis could become a very good reader/mailer.

A lot of non-serial mice had switches on the bottom that said "AM/ST". My current Falcon mouse does. IIRC its a simple case of changing a couple of wires around. Well simple if you know what you are doing. I could open up my mouse and see what changes the switch makes, but only if no-one else has a definitive answer.

I don't have Magic so I can't say if it works or not. To be honest, I
haven't used it myself yet. I only have use it very short on my Linux
box under Aranym.

ps. Isn't CAT capable to restrict linelengths to let us say 75 chars?
The second line "On both ... 1024x768x2'" was just one long line.
That is so with Okami and Pan (Linux version). With both I can reformat
the message (which I did) but I prefer not to do so.

Yes... and it is set to 74! so, I don't understand why i have to
manually add CRs, or lines override this limit :-(

In case you haven't done it, I believe you must rename AHDI.PRG to
AHDI.SYS after it boots

There is information on changing Atari mice to Amiga mice on Aminet under
the hardware/hacks directory from memory. Just do a search and it should
turn up. Obviously it's just the reverse procedure.

Regards,

Clockmeister.

> > hold true, if so can someone show me how it's done.

A search of Google revealed that it apparently the way you convert
mice from Amiga to Atari ST mode is to reverse pins 1 and 4 (which are
yellow and brown wires on many models). There is some inconsistency
on whether switching pins 5 and 9 do any good.

Anyhow, so long as you don't play with pins 7 and 8 (+5V and GND,
respectively), you won't harm anything.

Galen (who would like to remind everyone not to connect or disconnect
mice and joysticks while their Ataris are on -- the port isn't
buffered)

First of all: PC cannot read Atari-formatted disks.
Second: Atari is very happy with PC-formatted disks.

Solution: format your disks with PC. You may encounter 3 problems (4
if you use Windows XP).

1- Head alignment error
2- Rotationnal speed error
These where frequents with olds disk drives. While there are littles
programs that help you find and adjust the rotationnal speed of Atari
ST disks drives, there is little you can do with problem no. 1. It
can be done. We did that often in the 80's, the drives are made so.
Try to solve problems 2 to 4 before...

3- Track width. The read/write head of an 1.44m drive is slimmer than
the head of a 720k one. So, if you format a (already imprinted with
data) 720k disk in a 1.44 drive, the new format WILL NOT erase all
data on the disk, only the central part of it. When you try to read
this newly formatted disk in the old 720k drive, the wider head will
see two streams of data... Not be able to make sense out of this!

Solution to no.3: Find a powerfull magnet. I use a three inch wide
one from an old loudspeaker. Something big, really big. KEEP IT AWAY
FROM YOUR COMPUTERS AND DISKS!!!!!!!!!!!!!!

Why? Because this monster can wipe out everything that is magnetized!
(Read about anecdote below). That is exactly what we want:
Generously apply magnetic field to disk before formatting! That way
we are sure that all old data is completly erased!

4- Now, we almost all use Windoze XP and that SOAB will not format 720k disks. Are you sure? Not anymore because now i'm telling you the trick: Insert your freshly demagnetized disk in the A: drive, open a "command line prompt" and type:

format a: /t:80 /n:9 /u

Please respect the white spaces! If all goes well (it should) you now have an Atari AND PC perfectly compatible disk, just remember problem no. 3 above: If you format with 1.44m, write with 1.44m, write with 720k, write again with 1.44m and try to read with 720k, you got a problem... Read that again slowly...

That all folks! Have a good day!

"Welcome... to the real world." Morpheus, 1999

Benoï¿½t Morrissette...

Anecdote: it was with an Apple II. The guy had repeated problems with his 5 1/4 inch disks (160kb, by the way). Called the technicians many times. One of them finaly found the problem. He got to the guy's home to take a look. Remember the god old black thelephones we all had at this time? The guy had one beside his computer. He stacked all his disks between the phone and the computer. Ever looked inside this old phone? Two big electro-magnets for the ring. So, everytimes the phone ring: ereasure of diskettes !!!!

Have a nice day!

Benoï¿½t...

2427. Re: CAT & lines length (was: Re: Mint desktops)

Newsgroup: comp.sys.atari.st
Date: 2004-04-04 05:01:00 UTC
From: Ekkehard_Flessa@wun.maus.de
Message-ID: <200404040701.a47339@wun.maus.de>
Source record: 19523

Hallo Jean-Luc!

JL>Yes... and it is set to 74! so, I don't understand why i have to
JL>manually add CRs, or lines override this limit :-(

This shouldn't be neccessary. There are three settings relevant for
this issue:

1) "options/general[section edit/view]/line break" should be active
2) "options/general[section edit/view]/message line length" should
be set to 72 (or whatever you like)
3) options/swap[section miscellaneous settings]/send paragraphs
to Maus should be deactivated

if 3) is active, Cat will send long lines, _but_ will nevertheless
include a "soft" word wrap at the position set in 2). Outdated News
readers _not_ capable of displaying long lines (that is, wrapping
them to the actual width of the window), will not undo the "soft"
wrap and thus display the line break. otoh, news readers capable of
reformatting will recognize the "soft" line break and act accordingly,
that is simply ignore it if there's enough space in the window.

To check if the message is formatted correctly, you may view
$Cat\export\infile.txt. The lines in there (in the message body,
of course) should not exceed the line length set in 2). If they
don't, Cat is set up correctly, and the error (if any) is on the
reader's side. If they _do_, please drop me or Dimitri a mail, so
that the error can be corrected!

With best regards
Ekkehard

2428. Re: CAT & lines length (was: Re: Mint desktops)

Source record: 19524

Hallo Ekkehard!

EF>If they don't, Cat is set up correctly, and the error (if any) is on
EF>the reader's side.

This seems to be the case, if I look at
http://groups.google.de/groups?selm=
03042004224158i2C00155KLEC0A80004%40wanadoo.fr&output=gplain.

There, the line break is between "more" and "exactly".

Using soft line breaks has some advantages, too: firstly, paragraphs will be reformatted to fit the window. If the window is smaller than the usual line lenght, without them text would be formatted like this:

paragraph 1 paragraph 1 paragraph 1 paragraph 1 paragraph 1
paragraph 1
paragraph 1 paragraph 1 paragraph 1 paragraph 1 paragraph 1
paragraph 2 paragraph 2 paragraph 2

If there were soft line breaks, it would be formatted like this:

paragraph 1 paragraph 1 paragraph 1 paragraph 1 paragraph 1
paragraph 1 paragraph 1 paragraph 1 paragraph 1 paragraph 1
paragraph 1
paragraph 2 paragraph 2 paragraph 2

Much better, eh?

Secondly, Cat is able to word-wrap quotes correctly, _if_ it can recognize paragraphs.

Therefore, I'd even recommend setting 3) "options/swap[section miscellaneous settings]/send paragraphs to Maus" to true, as this shouldn't do any harm (soft line break is there anyway), but will allow for better text formatting with current news readers.

If this message arrives with "real" long lines, (e.g. the paragraph above this one), don't blame me or my Cat, but the gateway between MausNet(TM) and usenet.

With best regards
Ekkehard

P.S.: on transportation level, IIRC it looks like this:
"hard" line break: "text line 1<cr><lf>text line 2"
"soft" line break: "text line 1<space><cr><lf>continued text line 1"

Current news readers will recognize the <space> in front of the <cr><lf>, and then simply ignore the line break.

That error is 'No more handles'. I am not a programmer, so can't
tell you what the likely cause is. Did you run AHDI from the
floppy? And what ID does your hard drive have? AHDI can't tolerate
gaps in the numbering, so it should be 0 if it's the only drive on
the ACSI/SCSI bus.

>Do you have any suggestions about interchanging floppies between the
>ST and a PC? Like which machine to format the disk on, etc. It seems

If your Atari has a double-sided drive (only the earliest STs
didn't) it ought to read disks formatted on a PC to double density
(720 kB). Most OSs before Windows XP could do that (dropping into
DOS mode if necessarry) - but XP can't (without help, at least).

Hi Chris.
When you next time boot HDDriver.prg to see your selected
partition. Go to HDUtility.app after your in. Next click on general and
unclick scsi verify or scsi reset. I had a similar problem with HDDriver6.

interesting sense of humor Dennis (which, sorry but I can't share) that
gets pretty thin if you include ALL the programs in any platform that can
be mocked because of bugs and things that it lacks. But you're free to
knock it all you want. No one is forcing you to use it!!!
I think john Rojewski did a fine job in his last update which was a
major one that I recall few publically appreciating (although that seems
to be par for the course here)!
I wonder how many read and responded to the following file (IMPROVE.DOC)
he included in his last version? If not many, then it's no wonder to me why
he lost interest (that probably not being the only reason). Please note
that in this long list of possibilties that he included the prospect of
"Support HTML formatted email and news articles"!!!
==========
NEWSie Ideas

The following are ideas of improvements in NEWSie, the News/Mail/FTP/Web Browser program.
Please rate the following items in the order of importance to you:
(1 through n, or High, Medium, or Low)
'*' indicates items in progress

* Expand implementation of Edit Menu Cut/Copy/Paste
* Support for IMAP4 mail servers (port 143, RFC 2060)
* Support OLGA Client protocol (need English Docs)
* Support limited scripting capabilities, remote control, etc.
* Expand Browser to include graphics, forms, maps, tables, etc.
* Support StringServer package/protocol (have docs)
* Support DHTL package/protocol (Document HisTory - have docs, need server)
Create mail compression/verification/archival process
Support email address lookup in Address Book via 'name only' in Send/Forward/Reply dialog
Support multiple To: and cc: recipients directly in Send/Forward/Reply dialog
Support expansion of comma (,) delimited email names as separate unique recipients
Support selection/use of multiple Nicknames files
Support changing mouseform for "spinner(s)"
Build an internal editor, eliminate need for external editor
Add additional support for keyboard shortcuts
Support mail and news header continuation lines
* Support for ISO 8859 (International) character set
Add more color to NEWSie windows and dialogs

* Automatic recognition/notification of new release w/auto download
Support horizontal scrolling in windows
Produce user warning message for any Timeout condition
Make news_receive() completely re-entrant (w/header return area)
Make Function Keys "sensitive" to menu item 'disabled' status
* Make Toolbar entry selections "sensitive" to 'disabled' menu items
Re-organize Mail and News options, Move shared options to common area
Provide sort option for Nicknames
Add Browser Main menu title, w/associated sub-entries
Add Telephone Number field in Address Book
Provide 'Edit' button on Mailbox/Postbox Toolbar
Support browser Hotlist edit dialog (add, delete, etc.)
Add browser History edit dialog (add to Hotlist, delete, etc.)
Support 'KillFile' edit dialog (add, delete, edit, etc.)
Expand support for BubbleGEM to dialogs, etc. where possible
Support attachment of multiple files in email/news
Expand Address Book functionality to support a list of names, vs a single address
Utilize 'markup' chars to select multiple Address Books and/or Nicknames files
Support HTML formatted email and news articles
Display Attachment(s) as icons in internal viewer, allow extract/open/detach via mouse
click
Support GEMjing to play samples on machines where supported (via env/appl_find)
Support for Refresh for cached pages in Apache Servers (special http mime header?)
Provide Install/Uninstall program for NEWSie (w/multiple languages?)
Support Toolbar dynamic re-sizing to fit within window(s)
Provide new Extract path for extracted attachments (instead of Work Path)

Investigate:
Support PGP/RSA encryption for e-mail (RFC 2015 for MIME)
Investigate support for PPP_Connect (if docs available)
Investigate -silent option in MUNPACK.TTP to supress console messages

Other Ideas: (be as specific as you need)
==========

> What games (Atari) can be played on a Falcon with the MintOS installed?

Well basically all. If u have MiNT OS installed u still can boot in TOS or Magic or Geneva or whatewer. Thats the beauty of Atari OS-es. Different OS-es, different approaches and same applications. Without clumsy virtual machines or emulators and such... So if u don't have yet, GET yourself some boot manager, i use Xboot, and i'm happy with it. In actual MiNT OS, all GEM games should work nice. U can actually run most games which run from TOS and they work, but very small amount of games actually have Quit option, so its not really usefull, so u may boot straight into TOS for them...

U can also play some unix cli or xwindows games, but u have to be fan of those. On X simple logical stuff work okay, but for more complex stuff, machines are to slow... So i wouldn't count on those as some special extras :)

If Troll can write in your $HOME, then it can read it. Then read my other post. I suspect the paths for WORK and CACHE are not correct: you have not created them, or not fixed them in the preferences.
If these are located on ext2fs partition, maybe you should try on a VFAT one.

I saw the, or a, name. Antiword is one program that does this.

This is not much help, because I do not remember where I saw it, either
Chapelie, or as an RPM file for MiNT.

Search for antiword, and you might find it.

Good luck, Jim

Antiword is a Linux app (IIRC) ported to MiNT, so I doubt it also does
WordPlus files. :)

Maurits.

Ok, I've it working now. I had created the WORK directory in the root of
my test partition: WORK_PATH=K:\work\
I've placed that dir inside TROLL and now it works: WORK_PATH=K:\TROLL.FR\work\

Anyway this behaviour seems to me not correct. IMHO one should be able
to place the WORK dir on the spot one like.

The electrical and logical interface is the same, just the connector that is
different so you should be able to get one to work.
However the MEGA keybords are much nicer feel. And I don't think the ST
versions fit the the mega case.

```
X> That error is 'No more handles'.

This is the GEMDOS error -35.

From John Townsend's TOS error list:
-------------------------------cut-------------------------------
TOS Error #35, probably the most common error alert that is not self
explanatory, happens when a program you are trying to run has somehow
been corrupted. What it means is that TOS can not find some magic
numbers it expects to find either at the beginning or at the end of
the program file. This error is usually attributable to operator error
(as in trying to execute an archive or text file as a program), or to
bit rot.
-------------------------------cut-------------------------------

2462. problem with StonX

Newsgroup: comp.sys.atari.st
Date: 2004-04-05 16:25:23 UTC
From: Hugo Coolens <hugocoolens@skynet.be>
Message-ID: <40718873.D5D08DDA@skynet.be>
Source record: 19449

I've got StonX working with the following commandline:
stonx -size fullscreen -tos tos.img -refresh 2 -vbl 2 -chunky -boot c
-noaudio -fs c:cdrive/ -fs d:ddrive -disk a:/dev/fd0

Unfortunately I have some problems:
1. When I install something with more than one installation floppy,
I can't just enter the second floppy
2. Is there a clean way to stop StonX when fullscreen mode is active?
3. I seems that I just can't copy files in the linux-directories, as
they are not accessible under StonX that way, I first have to copy them
from a floppy under StonX to the simulated harddisk, which of course
isn't very elegant

Any solutions for these problems?

regards,
Hugo

HC> course isn't very elegant

IIRC there was a way to access the host file system, but you had to ensure
that all files names were 8+3.

No idea about your floppy problems, did not try that.

Have you heard about ARAnyM? I'd give it a try, it is way faster (JIT) and
still improving (though stable already). Host file system access, fvdi,
prepared HD image, raw access to Atari-style partitioned HDs, etc. If you
don't care wether the emulated CPU is a 68000 or a 68030.

Regards,

Alexander

2466. 50 hz boot disk wanted ST 50/60 hz question

Newsgroup: comp.sys.atari.st
Date: 2004-04-06 00:20:24 UTC
From: wboblitt@comcast.net
Message-ID: <83ffb5ca.0404051620.5bdc2698@posting.google.com>
Source record: 19454

Wanted: 50 hz boot disk (original or copy)

I used to have a copy of a 50 hz boot disk that someone from the UK sent me(later corrupted by a virus), I think the program was in an autorun folder and simply called "50hz.prg". It always worked great for me. Quite a few (original copy protected) games would not run without it. I tried downloading one with the same filename off of an FTP but it didnt seem to work as well as the one I used to have. If anyone has this program, especially an original copy of it, let me know I would be glad to paypal a few bucks for it plus postage. Also if there are any other programs that do the same thing I would like as many different 50hz booting programs as possible to try on various game software that is stubborn on US machines.

Does anyone know if it is possible to use a 50hz computer here in the US? I don't understand where the 50 or 60hz default comes from, the TOS (ie UK TOS), the monitor, or somewhere esle. I have always been confused by the Atari ST US/Europe 60hz 50hz phenomenon and am looking for a way to maybe have one computer set up to run the stubborn european games/demos without having to tweak it with a boot disk. (such as can be done with various consoles etc.) Thanks for any answers someone can give me. -SaTcom2

I am sorry, but there is no registration for Chris Swinson. Please send
me the serial number printed on your driver floppy disk by e-mail. You
can verify on my website that I am the programmer:

http://www.seimet.de/hddriver_english.html.

Hi Uwe,
I was wondering if I was in the database. And what advantages do you offer
for registeration? Can I upgrade to the latest Driver # at reduced or no
cost. My current version seems to be alright for my needs, but since you
keep doing changes to the program Version numbers. Maybe by version 10 or
11 I could use an upgrade.
Thanks for looking

That's of course assuming you get a CT60 first, as it is required to
use a SuperVidel with their current design. Otherwise, I'm afraid
Eclipse is the best you'll get on this platform. You could also get a
Nemesis or similar overclocking device and run 1024x768 (or higher) in
256 colors. Not quite truecolor, but not bad, and very compatible (at
least mine is...). The problem with that is, the higher-res you go,
the slower your machine gets due to bandwidth and CPU usage working
with so many pixels.

The 50/60Hz comes from the mains electricity standard. Your mains is 110V @ 60Hz, ours is 220v @ 50Hz. That was put in place donkeys ago. Tv's used to use the main for a sync signal for the screen, so you would have a 60hz vertical refresh. When computers came out that used the TV the video hardware had to match this frequncy or the picture would roll and sometimes worse. These days on modern TV's its not an issue anymore as TV's generate the clock themselves.

Regarding your ST, I never used one in the states, so I dont know about frequency compatibilty problems, I thought they was non existent - but I did sometimes run mine at 60hz, most games disks (not originals but menus) have an option to switch 50/60. Games soemtimes ran faster, or at least the music did.

Changing the frequency is a simple matter of a bios call. A program can be knocked together in a couple of minutes. The problem is getting it to stay at 60hz while you reboot so you can load the game. It can be done.

Registered users can upgrade to a new *minor* version (e.g. 8.12 to
8.13) without any fee.
Another advantage is ongoing support: If I find that the number of those
using my software illegally increases I will stop developing software
for the Atari. More and more frequently I see postings of users who are
not registered but are using my software...

I don't have the pin-outs in front of me, but the two mice work in
essentially the same fashion. So, it should be a matter of crossing a
couple of wires.

I don't know if they have the same (or similar) resolutions. So, using
the Amiga mouse may or may not be satisfactory with the ST.

YMMV...

I'm having a clearout, so I have to bid farewell to my mega which has been sitting around doing nothing for quite a while. It worked perfectly last time I checked (about 2 years ago?), except one of the buttons on the mouse was starting to play up a little bit.

I have:
Mega ST 4
Megafile 30 hard disk
Print Technik Realtizer Digitizer card (composite input - still frame output)(boxed w/ Instructions)
DFI Handheld Scanner (boxed)
Replay 4 Sound Capture card (boxed + instructions)
Cyberpaint
Deluxe Paint
Degas Elite
And a few other bits of software aswell

Oh yeah, and 2 Canon PJ-1080A printers aswell. (with some spare cartridges)

I probably could post it (in quite a big box!), but collection from Shrewsbury would be nicer!

If anyone's interested in any/all of this stuff, email me with offers and we'll arrange it.

Cheers
Jon

>Is there anyone there who can offer help?

It would help if you told us whether you still have an Atari
available. If so, try:

FW2RTF.TTP - A Shareware Program (c)Kevin Millican 1994
1st Word + to Rich Text Format File Convertor

There is also WP2RTF by J. Scheerder and a module for TUC (The
Universal Converter) for the same task.

The RTF format should be readable by various programs on a PC or
Mac and retains all text attributes.

Of course, you can also load the DOC files into 1WP and save them
as ASCII (switch off 'WP Mode' in the 'Edit' menu). This loses the
text attributes however.

Regards, /Peter/

Two bombs, and often multiples of two bombs, are doubled buss error.

The most common situation is that a program tried to write to location
zero, twice.

Good luck on your boot partition. It is probably some desk acc or even
control panel CPX program that does not like a Falcon.

Mysterious forces, and hard disk driver programs and scsi bus errors cand cause such problems. If you are running a hard disk driver program, it will also control the floppy disk drive, and if the hard disk driver program or the bus it controls has a problem, your floppy drive will have a problem. That probably is the mysterious forces problem, when a machine being upgraded or repaired suddenly has a not-working floppy drive for a while.

Need more details.

Can you please send me the serial number of your driver disk, so that I
can register you.
Please note that in general (with any software) one does not
automatically have a license because one got a hard drive with some
software on it. A legal copy always includes the corresponding license.
In case of HDDRIVER any copy includes a driver floppy disk and a printed
manual, and there is a unique license number printed on the floppy disk
label, so that the owner can register with me.

Not a trick question is it? Just plug into the line out on the back. The
speakers do need to be amplified though.

If you wish I can upload WP2RTF to the Belgian ftp-server or send it to
you by e-mail.

Yes I know that. I've created these dirs myself and yet it's still
impossible to get it working if the WORK dir stands in the root of the
partition where Troll is located.

e.g. WORK_PATH=J:\work\
CACHE_PATH=J:\TROLL.FR\cache\

In this case at start up Troll will ask me to set the paths.

ITOH WORK_PATH=J:\test\work\
CACHE_PATH=J:\TROLL.FR\cache\

This will work and so will the following path work too.
WORK_PATH=K:\work\
CACHE_PATH=J:\TROLL.FR\cache\

I'm really don't understand this behaviour. Faulty computer setup or bug
in your prog? I don't know.

You should be able to format a 720k disk on the PC and it should work on the
ST. I also formatted on ST and it read ok on PC. Just make sure you are
using a real 720k disk and not a HD disk. It sounds like you may be
formatting it on one and when trying to read on another it is seeing it as a
blank HD disk...

As a follow-up, I did see it reconise the drive on bootup once, looks like some reset problem also ? Even though I've setup the drive on my falcon the drive limited to 1gig in total (devided into 3 partitions) is there a limit on the STe ?

I have tried a TUS drive on the STe and that works fine, my other SCSI drive works fine still on my falcon, though refuses to work on the STe :(There seems to be a bug somewhere also since when I click on Desktop info from GEM with HDDRIVER loaded it resets the STe, even more problems :(

What version of TOS do you have, 1.062? Most of the 1.x TOS versions
have a partition limit of 256Mb. The Falcon, on the other hand, can
process 1 Gb partitions.

its 1.62, getting HD driver to work with the drive would be a start, though
I think its a hardware problem somehow, if I connet my TUS drive and auto
detect in HD options, the drive comes up, then if I put in my other scsi
drive, that one comes up but when rebooting nothing comes up again, the TUS
drive works fine, and both drives work fine on my falcon. There must be some
hardware problem with the SCSI drive itself making it not be reconised on
the STe :(

Unfortunately not. MiNT is created by volunteers and contrary to AmigaOS
it is open source. Hardware is under development by a small group of
enthusist as a Atari Coldfire Project:
http://acp.atari.org/
But Rodolphe also mentioned, that some people work to port TOS to
PowerPC platform and Pegasos seems like a most promising hardware option
to start with. It is most modern and relatively cheap too.

> Btw I was quite shocked a year before when I saw czbubaTech (?) site and
> that someone still produce Atari HW & OScode :)
>
> Bravo, Rodolphe !
Yeah, Rodolphe is great! It's a pity that so little TT users replied ti
his proposition of building 060 processor card for this machine. If that
would be similar priced to CT060 for Fallcon and would work with my
Matrix TC1208 graphics card, I would gladly buy it :-)

This can happen if some driver parameters/features cannot be retrieved
due to cable or termination problems or incompatibilities with the drive
and the STE's host adapter.

Is there any recommended scsi drives which will work best ? I have a
Seagate and Quantum drive and I have problems with both these on my STe.

At some point MS has removed support for formatting 720K disks from Windows.
You may need to boot from a WIN95 boot disk

>use the main for a sync signal for the screen, so you would have a 60hz
>vertical refresh.

Not quite. TV sets didn't use the mains frequency as a sync signal
- that was always in the transmitted waveform. But early TVs in
particular did not have very good smoothing on the EHT (extra high
voltage) supply for the tube, which was transformed from mains and
rectified. Manufacturers claimed high voltage rating smoothing
capacitors of higher values were too expensive. As a result there
would be a slight change in brightness across the tube face, known
as a hum-bar. When this was stationary, you could hardly see it.
But if the sync requency differed from the local mains frequency,
the bar moved up or down the screen, and that *was* easily
visible, and annoying. That's why sync was locked to the mains -
fine for people on the grid in the UK, which was synchronized over
most of the country, but not elsewhere (such as N. Ireland and
some islands, which had their own power networks or mainland Europe.)

Later, EHT was derived from the flyback pulses from energy stored
in the scanning coils, and that problem went away. When NTSC
colour was introduced in the USA, the field frequency had to be
changed slightly to prevent interference between the frame
frequency and the colour subcarrier (which is locked to the line
frequency), and is now something like 59.9-odd Hz. In '50 Hz
countries' (using PAL or SECAM) the field and line frequencies are
also locked to the colour subcarrier, but the field frequency
coincides with 50 Hz.

Most modern TV sets and some monitors will happily synchronize to
both 50 and 60 Hz field frequencies (and higher for PCs or Macs at
high screen resolutions). But older computers such as the Atari
and Amiga may have to use an uncoded video (preferably RGB)
connection for use in countries with different TV standards. This
is because monitors that accept TV-style signals normally only
decode either PAL or NTSC. Modern TVs in Europe, at least, will
accept NTSC signals - not sure whether US TVs will accept PAL.

From: xlator@cix.compulink.co.uk
Message-ID: <c545hl$g28$1@thorium.cix.co.uk>
Source record: 19405

In message <4073E9DA.158D3AE3@skynet.be>, hugocoolens@skynet.be said:

>is there a difference between wordplus and 1stword?

Not from the conversion point of view. Plus offers a few more functions and was commercial, where 1st Word was bundled with Ataris (in the UK, at least). The 'Style' menu was dropped and its functions placed elsewhere.

As you will know if you have tried to 'Show' a 1st Word DOC on the screen, or loaded it into any other text processor, the main problem is caused by the spaces. 1st Word uses characters 28 to 30 for stretch, indent and variable spaces and 31 for format line. These don't show at all with 'Show', so all words run together. In text processors they appear as parts of the 'pipe-smoker face' in the Atari font (different with PCs and Mac system fonts).

Char 27 (Esc) and one following character are used to switch style changes (bold, underlined, italic, light, super/subscript) on and off and a page break is represented by a C-cedilla (char 128).

If at some time in the future you no longer have an Atari, then it should be possible to use search and replace in a PC/Mac word processor, though you would have to do it individually for each character mentioned (for style changes, replace 'Esc' '?' with nothing, asssuming your editor takes '?' to mean a single character and asllows 'Esc' or 'Alt-027' to be entered in the 'Find' line).

Spam from VoteNader.org? (Or naderexplore04.org)

You may have received spam email recently that appears to come from our campaign, or be about our campaign -- perhaps the "From" and or "Reply-to" addresses look like they are coming from VoteNader.org. Or perhaps you have received a message that appears to come from an individual (if the address is real, the real owner probably did not send this email either) with suppressed recipients. Or maybe you received an email that appeared to come from yourself promoting our site.

These messages are NOT from Nader for President 2004, and these email tactics are NOT condoned by our campaign in any way.

UPDATE: Some of the latest forged emails have been made to appear to be coming from naderexplore04.org. Again, we are not responsible for this unfortunate abuse of email, and there is little in the technical sense that we can do to prevent this as it has nothing to do with our actual infrastructure. We are collecting information.

NOTE: The emails with malicious code (viruses, worms, etc.) often have attachments. Our campaign will NEVER send attachments in our announcement emails to you. Please be sure that you have anti-virus software and have the latest updates available for your anti-virus software.

Our hosting service has alerted us to say that Nader for President 2004 appears to be the target of what is called a "Joe Job." Such an event is where a spammer forges email to make it appear to have come from some other domain (such as ours -- or yourself). This is hard to prevent on our end and part of the insecure nature of the email protocol in general.

Members of our actual email list must request to receive email from us (either through Ralph's signup sheets or subscribing during our exploratory phase, or now on our campaign site). When one signs up for email they must reply to a confirmation message before they receive our list announcements.

Our public announcement emails come from "campaign@votenader.org," contain a "Paid for by Nader for President 2004" statement at the bottom, and have "updates@lists.votenader.org" in the "To:" header. Unfortunately, some of these indicators can be forged as well.

Most of the Spam that we have received complaints about appear to be forged from email addresses not associated with votenader.org (often forged to appear to be coming from government email addresses), and have

our website code embedded in the body of the email with hidden tags that contain random words that work to subvert anti-spam software.

If you are on our lists, you can ALWAYS unsubscribe at ANY time by following the instructions included at the end of our announcements. You can also use our unsubscribe page using the email address you signed up with.

If you are receiving this SPAM, we extend our apologies.

We will pursue the spammers to the full extent of the law.

For more information, please review these resources:

How Do I Determine the Source of an Email?
http://www.aota.net/Email_Spam_Prevention_and_Mgmt/emailsource.php4

Why Does This Spam Look Like I Sent It?
http://www.aota.net/Email_Spam_Prevention_and_Mgmt/spamfrom.php4

Coping with a Joe Job
http://www.sitepoint.com/article/sabotage-coping-joe-job/2

Please contact abuse@votenader.org with any questions. We have received many samples of the spam and are working to identify the source, if possible.

same thing, please forgive me if I ever said anything wrong and if I die don?t forget to pray for me.

Conspiracy theory?s real script: bypass operation and doctor who wanted to kill me. The cop kind of changed a bit, but he should have known before finding out the rest and finding out those _strange_ events and facts, all human beings are important, do not judge anyone, you never know may be they are telling the truth, may be they are in different situation, and besides it is not about others it is about who and what we are, we should treat others very nicely. Let us all learn to care about others because they are God?s creation, we do not want to hurt anyone, without any direct proof. And not because of what and who they are ? :), one day when you will look back you will understand this a bit more, but let us go through all the events for now :)

The fourth day, a day or two before the operation I woke up and told him a few things he did not know, I though all this was just a dream, I also told him not to tell anyone about it, because it is a top secret (at that time). During the operation I lost heart beat, I remember doctors saying his pulse rate is decreasing and panicking about it. By the way

when I was being taken to operation theatre, another doctor came who wanted to kill me, he kept telling them just kill him who will know, he killed two men he is a killer etc etc, the surgeon who was in charge told him "look I don?t know if he is a killer or not but it is my duty to save human life, and today you (the guy who was telling others to kill me) will not be operating in this room". The surgen should know, good men like you are the one who make the real difference in this world, one must never underestimate the value and importance of his/her actions, I wish and pray to God that God gives

Well, there literally hundreds of drives that should work. Should is a
very strange word. Seagate is not known to have problems. Quantum
Fireball, and Fireball only is thought to be a very good drive, but you
cannot boot an Atari machine from it. All other Quantum "should" work.

What kind of problems, and did you get the jumper list from the
manufacturer's website, and try all possible combinations?

If you have problems with both Seagate and an unidentified Quantum, you
may have some other problem.

If you can do cheap wire transfer into Germany from where you are, check
the atari-fachmarkt for drives that "should" work.

Jim

2525. SupraDrive Hard Disk Will Not Boot

Newsgroup: comp.sys.atari.st
Date: 2004-04-09 02:52:56 UTC
From: daustin3244@sbcglobal.net
Message-ID: <780921c3.0404081852.6266fc13@posting.google.com>
Source record: 19413

Can anyone help me?

I recently bought a SupraDrive Atari Hard Disk and I can not get it to boot. I've tried to boot it from the disk with the SUPBOOT.PRG placed in an auto folder and that does'nt work. I placed SUPBOOT.PRG in a auto folder and then started the Atari 1040st, the desktop should have loaded the following drives: (A)Floppy Disk (B)Floppy Disk and (C)Hard Disk. The hard drive (C) is suppose to load automatically when it finds a hard drive connected to the DMA port.

I've tried it on two different Atari 1040ST's and still get the same problem. The Supra Hard Disk connects directly to the rear of the Atari 1040ST DMA port. The instructions state to boot the hard drive initially from the supplied floppy disk and place SUPBOOT in a AUTO folder and the drive should boot and you should see the (C) drive icon on the desktop. That's not happening. I can't boot from the hard drive either, because there's no (C) drive on my desktop.

There's also another program on the Supra Hard Drive disk call SUPFIND, which searches for a hard drive connection. When ran, it prompts, "Memory Version: No driver found;, Hard Disk Version: No file found;, Floppy Disk Version: SUPRA v3.11;, and still no connection to the hard drive, so that's not working. Can anyone help? This thing is driving me nuts.....

I doubt it if both drives work on the Falcon and one works on the ST.
Try this:

1) connect the drive you want to use on your ST to your Falcon.
2) boot the Falcon
3) start the drive
4) run HDDriver from floppy
5) establish all partitions < 256MB (just out of curiousity, make
the first < 16MB)
6) install HDDriver to autoboot on C:
Then shut everything down and try it on the ST.

Don't forget about termination!

Galen

Very old equipment can occasionally die, but I wonder...

What happens if you put a passive terminator on the SCSI in connector?
(Such a part can be found for under $5US.)

I did try 256MB partitions on the ST, though HD driver wont even detect the drive most of the time. when it does, I auto configure (which works fine on my falcon) then after a warm start the drive vanishes again. On a couple of occasions it has booted from C: though it wont let me copy anything to the drive and after a few seconds it wont even open up C: drive. Its like the drive itself is loading the SCSI link too much and causing all kinds of faults. I have found about 5 SCSI drives now, all work on my falcon but none on the ST, all of them are Seagate which could be the problem. I've brought some other SCSI drives from Ebay today so hopefully I will have better luck.

I think the Quantum drive is a fireball, it works on my falcon but as you
say it wont boot from it. I checked out the site though I didnt see a list
of drives which should work as such. I'm looking to buy some other
manfacture of drives this week to give them a try

Sounds to me that either
1) HD is not partitioned and hence has no bootable C drive...
2) HD has partitions but none with the bootable sys file needed

Hi all,

I mentioned a while ago about some TV to VGA converters, I plan to make some of my own in the near future, I've found a source for them and for anyone who wants one you can buy one from my website at www.cps-electronics.co.uk under the Hardware webstore. I've tried 3 types and they all use the same circuitry so theres no differance. The quality is ok for these units. I plan to build a much better solution with more modern parts as soon as everything arrives. I havn't found a kit which uses Scart inputs yet, but my converter will have scart plus all the normal S-video and composite etc inputs. This should prove to be a really good converter once done. These things do take a long time to design and constuct, though I dont think they will cost much more than the ones out there already. Plus the extra benifit of higher quality video output.

While on the note of these things, I might convert some normal monitors to use on the ST, if there is interest enough I will bulk buy some 15" monitors and convert them for use on the ST. I dont think theres many multi-sync monitors out there these days ?

Keep the ST alive!

Chris

SND-thru manages Falcons sound matrix. It is possible to set matrix that way that u cant hear sound... However most newer mod players etc, set matrix on its own, so u may try one of those.. Try to get program called Iphigeny or SoundPass cpx and try setting the matrix... I suspect u use some cpx that was saved with some exotic settings. (u can for example in mtasking os start winrec and snd player and rerout snd player signal via winrec, so u can apply dsp effects etc on chipmusix played..)

>interesting sense of humor Dennis (which, sorry but I can't share)

You don't have to share it, I thought it was pretty obvious to anyone by merely looking at the header of the post, that it doesn't come from me.

>gets pretty thin if you include ALL the programs in any platform that can
>be mocked because of bugs and things that it lacks. But you're free to
>knock it all you want. No one is forcing you to use it!!!

Being forced to use it implies that there are no other options available, and like already mentioned in previous posts we have Okami and ASH Emailer, which both wipe the floor with Newsie. Not to mention that Troll is on the way as well...

And I'm not mocking about all apps on any platform. As long as Newsie was still "under development" I was one of the few people that didn't break it down. Now that is has a different status however....

>I think john Rojewski did a fine job in his last update which was a
>major one that I recall few publically appreciating (although that seems
>to be par for the course here)!

Look what clients are used to post here, most of the posters to this thread don't even use a Atari and/or Atari news client anymore. So does it surprise you that hardly anyone is interested? It's amazing to see that some people who haven't used Newsie for years and on top of that prefer to post from a different platform have come out of the woodwork.

>I wonder how many read and responded to the following file (IMPROVE.DOC) he
>included in his last version? If not many, then it's no wonder to me why
>he lost interest (that probably not being the only reason).

Newsie has a very small number of users, most of us have tried it out once and ran away from it as fast and as far as we could. If an app has only a handfull of users then you can't really expect tons of responses...

The reason(s) why he lost interest are not our concern, all I see is an app that promises to be a browser, mailer, news reader and ftp client... if it could make coffee also then it would be the perfect app!
The problem is that it's not really very good at any of these, it's not only the news reader that has problems, if it would be able to make coffee, one would probably get a very lousy cup of coffee served.

>Please note that in this long list of possibilties that he included the
>prospect of "Support HTML formatted email and news articles"!!!

Noted...

>The following are ideas of improvements in NEWSie, the News/Mail/FTP/Web
>Browser program.
>Please rate the following items in the order of importance to you:

Sorry, but I'm not going to rate anything here at all.
Newsie died a natural dead, IMO we should let it rest in peace and move on, *there are alternatives*, and they are better/more advanced/more stable then Newsie. At least 90% of the improvement ideas are available (for quite some time) in Okami and ASH Emailer.
Having choice is nice, but IMO the few remaining programmers left on this platform should concentrate on other stuff.
But let's talk in about a year or two from now...

>I believe that Newsie is not compatible with my news server but that's a
>guess since I don't use other news readers! One day my post will be seen
>and the next day it's gone (plus there;s times when I'm told that a replt
>was posted but it's not seen here. There are those that suggest using Okami
>but I never could get it set up (be would be nice if it had an

I know you don't really want to hear this, but the culprit is Newsie, go back some 5-6 years in time and do a search on Google, you'll find lots of posts from ex-newsie users facing a similar problem.
Like I said: it's crap.

Yes Okami is not really easy to set up, but there are some very experienced Okami users here, I'm convinced that they'll help you through any possible difficulties like a breeze.

But let's put an end to this thread, all what matters in the end is that you enjoy using Newsie, which you obviously do. But like with so many apps, I'm afraid you'll have to be pleased with what you've got.... all the Okami and ASH Emailer users would love to see some extra bells and whistles added also to their favourite news/mail client, it's not going to happen either. Let's hope that someone proos me wrong, but until then I'm convinced that on this platform giving an app the open source status doesn't work. Like I said, let's talk in about a year or two...

Cheers from Belgium

2544. Question about Atari ST floppy disk format

Newsgroup: comp.sys.atari.st
Date: 2004-04-10 13:42:36 UTC
From: Markus Lindström <rrrrominet@hotmail.com>
Message-ID: <4077f9c1$0$1359$ba620e4c@news.skynet.be>
Source record: 19432

Hi there!

I just wanted to ask a simple question: which format does the Atari ST use for its floppy disks? I'm asking this on behalf of a good friend of mine who tries to "revive" his memories, stuck on dusty disks.

Windows doesn't seem able to read it, so I'm guessing it's not the classic FAT format.

Is there any way to read them? Or even better, does anyone know if Linux supports this format?

Many thanks in advance,
Markus.

>

By default it is calssic FAT format. It just does not have the correct vaule
in one of the header fields and Windows sulks.
Also see below as some folks were not happy woth the default.

> Is there any way to read them? Or even better, does anyone know if Linux
> supports this format?

If you have an operating system that permits direct access to the floppy
then they can sometimes be read by the GEMULATOR Explorer which you can
download from http://www.emulators.com/download.htm. Otherwise if you have
an ST there are programs about that will patch the header.

Also note that many folks formatted their disks to have more sectors per
track and/or more tracks than standard. Reading these disks can prove
challenging even on an Atari.

Actually, it *IS* FAT, but the default Atari ST format is just different enough that DOS/Windows can't cope with it. Some Atari disk utilities created DOS-compatible versions of the format, though, so it's conceivable you could read some of your friends disks from Windows.

I believe there's an Atari utility that'll write a new boot sector to the disk, making it readable under DOS/Windows. I don't recall the name of the utility, though, and of course as it's an Atari utility, it won't do you much good unless you run an Atari emulator to do it. I don't know if there's an equivalent DOS or Windows tool.

> Is there any way to read them? Or even better, does anyone know if Linux
> supports this format?

I'm pretty sure that Linux's FAT driver (filesystem type "msdos", or possibly "vfat") will read Atari ST disks, but I'm not 100% positive of that. If you try it and have no luck, try the mtools package (the mcopy, mdir, etc., commands). I can't guarantee that it'll work, but it might.

Normally it is FAT12 format. But some early STs (TOS 1.0?) had a bug that when you formatted a disk it was not read in a PC... Try a newer TOS revision.

Tim

There are lots of variants but most are actually FAT. Some games disks use other formats. There may be from 9 up to 11 sectors on each track but most Windows versions can only cope with the standard 9 sectors format.

If the disks were made on a pre TOS 1.4 Atari (before 1989) you can't normally read them unaltered in MSDOS or Windows.

Floppies formatted in the standard desktop on TOS 1.4 and onwards should work in Windows. Just tried a 720 DD disk in Windows 2000 without errors.

For safety keep the floppy WRITE PROTECTED all the time. Windows tends to write to the floppy without notice!

>Is there any way to read them? Or even better, does anyone know if Linux
>supports this format?

My pc did not recognise anything but a standard HD 1440 floppy when I booted into Linux and just tried a "mount /floppy" command. I guess it can be done by adding to the kernel...

Just for fun I also booted my Atari TT into m68-k Linux and yes, both DD and HD floppies works fine. Even tried with an old floppy last written to in 1990 on my TOS 1.2 MegaST from 1987 and it mounted fine.

Both the pc and Atari are running Debian Sarge.

Back to Win2000 and running Gemulator2000 emulator from http://www.emulators.com :

To my surprise i could not read old floppies from TOS 1.2 at all. This was in "Atari disk mode".

Rebooted to Win98 (I have 4 OS'es on the pc!) and as expected no luck with the old floppies.

Launched "Gemulator Explorer" which is supposed to be a tool to read non MSDOS floppies. Here the old floppies showed up but with garbled filenames as long as they were 9 sector formatted. Also tried DD floppies

with 10 and 11 sectors but nothing except strange sounds from the drive... These floppies were formatted with FcopyProIII.

As a last resort I booted the Aranym liveCD that contains a minimal Knoppix Linux dist with an Atari "virtual machine"/emulator right from the CD. You can get it from http://aranym.sourceforge.net/livecd.html with the actual CD ISO file from http://sup.zln.cz/~joy/livecd.html .

Finally some luck! My old TOS 1.2 floppies read just fine as long as they were standard 9 sector/track formatted! When I tried disks with 10 and 11 sector formats I got an error message and an empty window.

Note that all floppies worked just fine on my Atari TT running Magic with a HD 1440 drive.

Conclusion: If you can't read the floppy from the Windows -98 or -2000 desktop only Aranym might be able to. Extended formats can't be read at all.

There are other tools I have not tried like the STeem emulator.

After posting this I really have to reboot and check how Debian m68-k reacts on the 10 and 11 sector floppies on the very same TT they were formatted on...

FWIW, I just tested on a Gentoo system running a 2.6.3 kernel on an AMD64 computer. I had no problems reading an ST-formatted ~790KB disk, although access was slow. (I don't recall what I used to format that disk, but obviously it was some form of extended format.) Single-sided floppies gave me problems, though. I suspect that creating an appropriate device file and using it rather than the stock /dev/fd0 would give better results with them, but I don't know offhand what device major and minor numbers would be required, or if this feature is supported at all.

I don't know why you didn't have better luck with 720KB Atari floppies under Linux, unless by "anything but a standard HD 1440 floppy" you meant you tried single-sided disks. I've never had trouble with 720KB DOS floppies under Linux, and if the Linux FAT driver can cope with the Atari FAT format's peculiarities, I don't expect it'd have problems with 720KB Atari disks. I don't believe there are any Linux kernel options relating to this support. It's conceivable, though, that we're now well enough beyond the double density days that chipset manufacturers are starting to skimp on support for that format, and that you happen to have a chipset that's so affected. This is HIGHLY speculative, though.

I've had almost no difficulties with discs, although it did take a few
attempts to find the right device to handle single sided discs[0].

If it's already there, try mounting single-sided discs using
/dev/fd0u360. If it's not, and it should be since it's been there in all
the SuSE, RedHat and Debian systems I've used, create it under /dev with
major 2, minor 12.

>I don't know why you didn't have better luck with 720KB Atari floppies

>Atari disks.

The Linux FAT driver has handled all the different Atari formats I've
thrown at it, with just a couple of exceptions.

The first is where I've formatted, and written to discs where the number
of tracks is more than 82. Some drives were able to read the last few
tracks, some can't, but this is a physical limitation of the drives and
I stopped using such extended formats after being bitten by it when I
was using an old STFM and external drive[1].

The second is using 11-sector DD formats, or 21/22-sector HD formats,
where this can often be very hit and miss.

>I don't believe there are any Linux kernel options relating
>to this support. It's conceivable, though, that we're now well enough
>beyond the double density days that chipset manufacturers are starting to
>skimp on support for that format, and that you happen to have a chipset
>that's so affected. This is HIGHLY speculative, though.

I think this may be just speculation. All the boards I've used,
including my latest Nforce[2] board, has no problems reading Atari.

[0] After a hunt I managed to find one of the few remaining SSDD discs I
still have, just to check my memory. Thankfully, I still have one, and
my memory wasn't far off[3].

[1] IIRC it was an old Power Computing thing which took power from the
joystick port and could handle 84 tracks easily, used in conjunction
with an internal single sided drive until I replaced it with a double
sided drive. That's when the internal drives limitation bit me, since
that couldn't read past 82 tracks.

[2] Six months old and I seriously regret buying it. It's a pain to keep
having to redo the setup with every kernel upgrade because NVidia
haven't released their drivers as open source.

[3] I almost had the device right. Since it's been a while, I tried
fd0d360 instead of fd0u360.

Regards,
David Bolt

So what do? The manuel states that you can boot the hard drive from the supplied disk by just running the SUPBOOT.PRG. I opened the case and indeed the hard drive is running. I noticed that when I run SUPBOOT.PRG a red LED on the hard drive blinks off and on a couple of times then stops blinking and still no connection. When I install the C Drive then save the desktop and restart the Atari with SUPBOOT.PRG in the auto folder, the C Drive disappears. Also when I install the C Drive and double click on it a message appears stating: "The drive you specified does not exist. I ran another program call SCSI-Tool ID-Test and it displays that the hard drive is ACSI 1 RODIME R0652 5.02 is that telling me that the Atari recognizes that the hard drive is connected to the port?

What's a passive terminator and how do I connect it. Here's a web page
that shows the inside of the Supra hard drive.
http://homepages.tesco.net/~david.barraclough/atari/supra.htm

2554. Name the game

Newsgroup: comp.sys.atari.st
Date: 2004-04-11 01:43:04 UTC
From: Ian McCall <ian@eruvia.org>
Message-ID: <c5a7r8$2qccls$1@ID-230144.news.uni-berlin.de>
Source record: 19442

Hello.

I'm trying to track down a game. This would be a very early ST game, and it had a first person view where you fired energy balls (which bounced) at a variety of mostly geometric-shaped foes. Set in a desert, as far as I recall.

I realise this isn't much to go on, but it's hard to describe and my memory isn't great. I believe you manned a gun emplacement, though you couldn't see it. It was set on an alien world, was in a desert I believe (had a sand-coloured grand, I'm sure) and, as I mentioned, your amma used to be in the shape of a ball and it bounced. I'm pretty sure that all of the foes were geometric shapes, but I could be wrong about that.

Any clues? Any questions? Thanks in advance for any information.

Cheers,
Ian

I use a program call IBMCNVRT which allows you to format a disk on your atari and makes it readable on a PC so you can copy the atari files you need then run them on your atari.

I tried that, actually, but it didn't work. I ended up firing up my
TT030, and discovered that *IT* couldn't read these disks, either. I'm
starting to wonder if I might have used some weird 400KB format or some
such; it's been about 18 years, so I might have forgotten such details.
I've got about half a dozen of these floppies left, so I doubt if it was
just one disk gone bad. (Fortunately, I've got backups on other media.)
In any event, I used the TT to create a new single-sided 360KB disk, and
was able to read it in Linux on my AMD64 system with no problems. Of
course, the TT's version of TOS is far more recent than that on any
system that would normally use a 360KB format, but given that you say
you've done this pretty extensively, I doubt if that's really an issue.

I did say it was HIGHLY (my original emphasis) speculative. ;-)

> All the boards I've used,
> including my latest Nforce[2] board, has no problems reading Atari.

The AMD64 test system I used is obviously quite new, too. Still, some
chipset manufacturers might conceivably have begun quietly dropping DD
floppy support while others continue it. I think this is unlikely, but
it's conceivable.

> [3] I almost had the device right. Since it's been a while, I tried
> fd0d360 instead of fd0u360.

These specific-size device identifiers vary a lot, from distribution to
distribution and/or over time. I believe I've seen both "d" and "u" in
that position.

I get this problem when I put in a floppy disk that was formated
on a different floppy drive. Usually means the two driver are not
compatible because one is out of alignment. I get this problem
with the internal drive of my STe.

If I remember correctly, it was the other way round- i.e. Microsoft misinterpreted the format specifications, so DOS and its offspring require certain values in the boot sector which, by the specs, were not obligatory.

Btw, some versions of TOS do produce MS-DOS-compatible floppy format, and some other can be patched to do so. There are also utilities which produce the compatible format, and some others which can change an existing format into a compatible form (it is just a matter of several bytes in the boot sector which are not used for anything, anyway).

The desert bit did it :-)

It had a prequel too, Encounter I think. I remember playing it on ahem, the
C64..

I see then even more need for those who "ran away" to have responded
to the doc. At least they could have told the author why they flee so
fast or at least point out major bugs (in a polite way of course :)

>The reason(s) why he lost interest are not our concern, all I see is an app

thanks for offering someone elses help but I'm not interested!
I'm sure that if Okami is as great as the currnet users say it is then it
would be more widely used by us inadequate or just plain lazy consumers if
it were easier to install.

With newer STe software that supports it, yes better sound and graphics
(Like Amiga, stereo sound and 4096 colors), and support for Jad Pads.

But there aren't many titles that were made to use the extra features.

Tim

Okami is very stable but definately not bugfree. On the other hand I have
a Windows and Linux pc as well (turned on right now) and I still mostly
use Okami instead of Mozilla, Pan, MSIE, Agent or whatever mail/news
programs there are.

On the downside Okami development has stopped since long.

> used it.

I agree. I didn't really think I really *needed* multitasking, but I thought I'd give Geneva a try about 6 or 7 years ago, and now I couldn't imagine using singletasking TOS full-time. Multitasking is very nice and kind of addictive once you get into it. For example, I edit all my web pages on my Falcon using CAB and either QED or Papyrus (depending on how much control over the page's appearance I want), and it's great to be able to edit a page, hit save, and CAB automatically updates itself so I can immediately view what changes I've made. Can't do that (that I've seen) using a PC/Mac browser and text editor. Wonderful!

Anyway, if this person really doesn't want to spend any money, and likes TOS that much, they could easily download the latest Mint binary and AES 4.0 or 4.1, put Mint in their AUTO folder, and simply edit a the MINT.CNF file so that it just contains GEM=<path to AES>\GEM.SYS. Just reboot and you'll have your usual GEM desktop with a few extra features, and most importantly multitasking. Or they could get XaAES or MyAES and Teradesk if they don't mind a different environment, and don't mind a slightly more complex installation. Either one should still work fine in limited memory as long as you don't have a full Mint distribution installed.

Huh! is someone in a different country supposed to know this? there was no
USA in the post!. it could have stood for FL= Flixton near Nobb End, and if
FL stands for Florida, Ma should stand for Manchester or change FL to Flda ,
just when will Americans admit that there is a whole other lot of countries
that have the Internet!!

>I think I have two, done through System Solutions, for TT and Hades.

Good to see you on the group again ! Is your Hades still sick, or did you manage to get it fixed in the end ? I know there is not a lot of support for getting them repaired these days, but it seems that sometimes all that needs doing is some re-soldering on the circuit board, so it may be worth having it checked over.

I'm sure Uwe will contact you about the registration, but others should be aware that System Solutions no longer supports Atari products at all. The UK dealer for HD Driver and is:

Officially the developement is not stopped. I'm almost sure if you send
Jos a bug report he will try to fix it. OTOH new things like support for
UTF8 will not come, mostly because only a few guys are still using
Okami. If more Atarians would work with Okami Jos would probably restart
the developement.

The whole range of /dev/fd? are present on my pc Debian system. I did try
a good floppy written by TOS 1.2 desktop without success with and without
using the correct /dev/ and even tell it -t FAT. The latter gave "not
supported by the kernel" back. The very same floppy is readble under
Aranym. Guess I should have tried to read binary data with DD but did not
do that...

Also tried a 10 and 11 sectors/track DD floppy in Debian m68-k on the TT
and no problems what so ever with just a mount /floppy . I suppose Atari
Linux handles floppy accsess very differently and we all know the
controller chip (AJAX in my case) in the Atari can handle extended
formats :-)

Having appr. 10 working Atari computers here with Ethernet to some and
nullmodem SLIP to others I can live with the fact some old floppies are
not readble on the pc...

Just came across a source of Brand New Mice for my ATARI the other day. I'd been struggling with my almost dead one for some weeks, but managed to buy a brand new one in a shop in London called Blue Audio Visual for ï¿½6.95. They told me that they've got at least 50 left still. Not sure if they do mail order or not, it may be worth giving them a call? Anyway, it's a great little secondhand music & Hifi shop with loads of interesting goodies. Address is 61 Upper Street, Islington, London. 020 7704 1124.

I know just what you mean. With the exception of making backup disc
images about 6 years ago, it's been something like 16 years since I was
regularly using SS discs. All my non-commercial discs were converted to
DS as soon as the internal SS drive was replaced.

>I've got about half a dozen of these floppies left, so I doubt if it was
>just one disk gone bad. (Fortunately, I've got backups on other media.)

I only tested standard 360KB discs, since those were all I had left for
testing, so I wouldn't call it extensive. It was just enough to find out
what worked for me, and what didn't.

<Snip>

I suppose it could be a possibility, but I've not yet seen a system
where they weren't supported under the BIOS. AFAIK, this shouldn't
really make a lot of difference since the BIOS is only used to get the
kernel, and the initially required modules, loaded. After that, all
hardware access bypasses the BIOS. This is all an "AFAIK." This being
Usenet, someone will be along soon enough to correct me, whether I'm
right or wrong :)

>> [3] I almost had the device right. Since it's been a while, I tried

I think it's more over time, than distribution to distribution, although
they seem to have stayed the same over the last several years. I've not
noticed any differences, specifically with the SuSE versions but also
with non of the other distributions I've dabbled with.

Regards,
David Bolt

Dont be so rude...

I'm from Santiago, Chile (South America).
As you can see, my primary language is spanish, not english, and i'm used my mailbox address just in eBay.
So .. my mistake... then , my mailbox is in Miami, Florida , USA. But i'm from Santiago/Chile.

"Shy tot" said that have a falcon for sale.. It is true ? right ?
Please contact me. I want to know how much would it be.
I Guess shipping is expensive from UK to Chile.. But depending on the price, i'll be willing to buy it.

Thanks a lot....

2597. Re: Question about Atari ST floppy disk format

Newsgroup: comp.sys.atari.st
Date: 2004-04-12 19:57:37 UTC
From: Jim DeClercq <jimd@panix3.panix.com>
Message-ID: <c5esbh$5dd$1@reader1.panix.com>
Source record: 19386

Yes, I did read this thread. When complaining about Windows, it helps to know which one.

There is a Microsoft Boot Sector Standard, which calls for the boot sector of a floppy contain information on how it is formatted. A modern drive can read 22 sectors, 82 tracks, and write 20 sectors, 82 tracks.

An Atari reads this boot sector into a 2K buffer, and uses it. A first or second generation floppy drive will read and write 85 tracks and 22 sectors, and any Atari with a clock of 16 MHz to the drive will read and write those disks, no problem. That is, with a drive that is not trying to save some piddling amount of energy.

The only Windows that reads such disks is Windows 95, which was Microshafts last floppy disk distribution, so they followed the standard they wrote so they could save a disk, and format to 1.62 Megs, which is 20 sectors, 80 tracks. That version of Windows will read and write to any disk that is formatted withing the physical limitations of its disk drive.

Many other versions of Windows will read a disk formatted to 720 or 1.44 on any TOS 2.06 and up, I think.

But now I have access to some Dell machines running Windows XP, and those will not read disks from my machine. They will format a disk that my TT can read, and write to, and that they can read and write to, and that is how I use them.

Some earlier version of Windows I met at Kinko's, and learned that the file selector would read my disk, and open an application based on the extender, but the application itself could not read the disk.

So, the format may be just fine, but whether it reads in Windows depends a lot on which one, and how.

Jim

You're quite right about the BIOS. I was thinking of the chipset
(hardware on the motherboard) floppy controller support, though, which
all floppy access must use, regardless of OS or driver. It strikes me as
unlikely, but conceivable, that a chipset manufacturer might get cheap
and drop support for the DD media, while leaving in HD support. Most
people probably wouldn't even notice, given the fact that new DD disks
haven't been commonly used in the PC world in years.

If a drive is sometimes detected, sometimes not, there is definitely
something wrong with your hardware, in particular with termination or
cables. Unreproducable behavior, like you have described it, is typical
for that.

Greetings all,

From May I will be working on the publication Retro Gamer as a staff writer and my first job will be to write the news pages. I've already penned in some of the new games (and other such software) that is underway as we speak. I've been asked to cover emulation and remakes as well, something that until recently I have not spent too much time on, so anyway if you have any news you think would be relevant for Retro Gamer (Remakes, emulation or whatever) please don't hesitate to email me. Of course, I'll be looking at good sites such as raww.org, atariage.com and these news groups.

Cheers,

Shaun.

2615. Power supplies in the UK

Newsgroup: comp.sys.atari.st
Date: 2004-04-14 11:22:02 UTC
From: Ian McCall <ian@eruvia.org>
Message-ID: <c5j6sr$286ls$1@ID-230144.news.uni-berlin.de>
Source record: 19304

I've been offered a 520ST (not FM) and two external drives (533s? Ca't remember the model), but the current owner can't find the power supplies.

Is there anywhere I can cheaply get power supplies for these things in the UK? Obviously if it gets expensive then it rather negates the point of having one, but still - wouldn't mind if I could lay my hands on this stuff.

Cheers,
Ian

That's true, althought it runs my beloved Fate Gates of Dawn :-) It
won't run Falcon-specific games, but it runs some of the ST games.

> and the stock video capabilities are nothing to get excited about that's for
> sure.
By today's standards 320x480/256colours or 1280x960/2 is nothing
special. But it is quite easy to find on eBay dedicaed VME graphics card
for TT (and Mega STE). I use famous Matrix TC1208 with dedicated version
of NVDI 3 and GEM programs runs very nice at 1280x1024/256 col./80Hz or
832x624/16.8 million col./85Hz :-)

> falcon has many games dedicated to take advantage of it.
There are not too many of them (compared to ST), but you are right -
these games won't run on TT at all.

The clue is that TT was the most professional Atari ever build and the
fastest one (CPU-wise). Many serious publishing companys used it as a
platform for wonderful Calamus in the nineties. And its original case is
one of the most beautiful - even today :-) You can expand it using
ordinary 3.5" SCSI HDDs and add up to 256MB of fast 32 bit RAM (depends
on the TT RAM card).

The only way is to get Eclipse PCI expansion board and ATI Rage graphics
card - but you'd have to put Falcon in bigger case then. Read here more:
http://website.lineone.net/~cortex/pages/eclipse.htm

Hi all:

If you are in need of SCSI drives this could be a neat solution. I got this small card on ebay. It plugs in the back of any IDE drive and makes it work as SCSI wide or ultrawide depending on the card model (U or UW). It is the ACARD 7720UW. This will work on a Falcon but you will need to use your existing SCSI interface if you use an ST.

http://www.acard.com/eng/product/scside/aec-7720u.html

I use my card on my Mac G3 as an external SCSI (IDE 4gigs) and the card makes the comp see it as a reg SCSIdrive I can even boot system X or 9.2 from either partition.

You could find this card on:
ACARD BRIDGE

I am sure it will work on any ST and I could test it on my Falcon but do not have time for it at the moment :(

No, although it's just a matter of switching one wire to convert between
Amiga/Atari hence a lot of aftermarket mice supported both with a switch.

2640. ST RGB signal - bad grounding?

Newsgroup: comp.sys.atari.st
Date: 2004-04-15 20:54:42 UTC
From: Tom McEwan <captaininsanity@ONAYAMSPAYuk2.co.uk>
Message-ID: <c5msro$r8v$1@news8.svr.pol.co.uk>
Source record: 19329

I've noticed when using my ST with an RGB monitor that it seems quite incapable of displaying an actually black screen, the closest it can get is a dark grey, which is kind of annoying (especially playing space games!), and I wondered if anyone here could help.

The screen and cables are probably ok, because with the ST switched off the screen does go properly blank (ie, completely black) Otherwise the graphics seem more or less alright (signal cuts out or rolls for a couple of seconds occasionally, perhaps there's also a dry joint somewhere in the synchro circuits). Is this a known problem with aging STs (or just STs in general - I have heard that Atari's 8 bit machines were notorious for having poor video interface circuits, but I've never used one myself), or is there more likely to be something wrong with my video cables somewhere? I've checked continuity with a multimeter, the ground line appears to be connected ok, so my intial hypothesis that it might be floating somewhere because of a broken wire is probably wrong.

Can anyone suggest anything?

Thanks.

Tom

BTW, a colleague at work today mentioned a machine made in the 16 bit period (68000 based) that seems to have been completely overshadowed by the giants of the era, the Amiga and ST, the machine in question being a Sinclair "QL". Can anyone tell me anything about these things? I've never heard of them before. Maybe google will turn up something interesting.

Hi Tom,

Are you sure you haven't got the contrast of your monitor turned up too high since this is a easy probable casue of not going to black.......

Chris

Its more likely to be the monitor. If you cant get rid of it with brightness/contrast controls then you maybe able to adjust the pots inside the case but I wouldnt recommend it unless you are comfortable working around mains voltages.

The sinclair QL was a 68008 based machine. It was Sinclair's last attempt at making a serious use i.e not for games - home computer, which was Clive Sinclair's intention with the Spectrum. Not really a 16bit machine, depends on what your definition is. The 68008 cpu was only 8-bits wide on the data bus, but apart from that it was the same as a 68000 inside (with 32bit registers).

2651. Need help remembering a game

Newsgroup: comp.sys.atari.st
Date: 2004-04-16 08:27:55 UTC
From: mp__@hotmail.com
Message-ID: <32853c1a.0404160027.1b47fcee@posting.google.com>
Source record: 19340

I have this vague recollection of a game on the ST, kinda like one of those tile-matching games (Shanghai or whatever it's called) but when you clicked two tiles, not only did they have to have the same pattern, but they also had to be connectable by some small number--possibly 3?--of horizontal and vertical line segments, which was not always possible given intervening tiles, so the order in which you matched them was important. And you played against the clock.

Does that ring a bell with anyone?

I'm hoping someone will recognize the game and be able to refresh my memory as to exactly what the "connectability" rules were. Or perhaps there's a PC version out there?

Thanks,

Michael <-- has an ST in storage

You plug them into a little hole under the computer and push them round on a rubber mat, as you do a little arrow moves around the screen, when it is on top of something you want you press one of the two buttons that are on top or the mouse

Source record: 19248

Some people could get to the site and some couldn't. Well, I think I know
why.
I changed hosts. The DNS details don't get update at the same time globally.
Some DNS servers may have had the old details, some the new details. In
theory all DNS servers world-wide should have the correct details now. I
think it should take no longer than 36 hours for them to synchronise.
So please try again if you're still interested: www.uvk2000.com.
Apologies for the hassle.

Hi John,

>>If an app has only a handfull of users then you can't really expect
>>tons of responses...
>>
>I see then even more need for those who "ran away" to have responded
>to the doc. At least they could have told the author why they flee so
>fast or at least point out major bugs (in a polite way of course :)

Ok....I ran away from it once as well. Like many people I contacted the
author pointing out certain flaws in the app, but there's a limit to being
helpfull, and certainly when its coming from only one direction. The way I
see it is that he couldn't fix them or he didn't give a damn about it. I
don't really care why, how, what the reasons were, all I know is that in
practice nothing changed. So I figured it was time to move on and look for
something better, I found it BTW, and I'm using it for almost six years
now. I could have dropped the Newsie author a line of course telling him
why I opted to use something different, but that would have been quite
pointless, he knows very well what's troubling Newsie...

>by today's net standards same with CAB, HSMODEM, Cubase and dialers that
>can't access certain ISPs.

Ho ho... it depends a lot on the stack that's being used also. I still
have to see the first ISP to which Iconnect isn't able to connect to. And
as for CAB, I've used and tried every OVL available for it, but always
return back to the one that's originally supplied with it. I must have
written this a thousand times by now.... use CAB with IConnect and the
Iconnect OVL and be pleasantly surprised.
BTW what's up with HSMODEM? AFAIK it does all it promises to do: speed up
the serial ports....

> I agree that Newsie is lacking and bugged (rather than putting it as
>"crap"). No new news there! But why the negative post because the sources
>are now public?

Because open source on this platform doesn't work, it's as simple as that.
There's a group of people here which thinks different, but they have very
little to show... one could say, leave them in peace, but they are partly
responsible for people dreaming here. Giving an app the open source status
is one thing, the app being actively maintained and developed is another
thing, and it's right there that things don't really work out to well.
Have you any idea how many ex commercial/shareware/public domain apps now

carry that status? And what in practice has changed? Except for the new status these apps are just as dead as they were before.
The way I see it is that the remaining bunch of people we call programmers are tied up doing different things, there's only so much one person can do also of course. And it's like you guys think that there are hundreds of programmers out there all very eagerly waiting to get their hands on a new project! Look around .... the situation had never been as worse. These programmers are a figure of our imagination, they don't exist. They're gone, and the remaining bunch is occupied with something different.

>Open sources been asked for from Alexander Clauss for CAB. Should he
>deserve the same treatment if he (ASH) had let it free?

Are you guys living in coockoo land? CAB is still being sold, not a lot of course, but every month at least a couple of copies. BTW, you shouldn't be asking Alexander Claus but ASH, CAB together with IConnect are one of the few apps made in commission for ASH, the copyright belongs to them, about all you can get from Alexander will be the sources for CAB 1.5... if these don't interfere with copyright of later versions. And don't forget that CAB is an example of teamwork, we all associate Alexander with CAB, but about every programmer that had something to do with ASH chipped in....

And it's about time we face it: the **only** reason why CAB is not further developed is theft. Someone at ASH once told me once how many versions of CAB that actually have been sold... I was stunned, and it's not only CAB, but about the whole ASH catalogue. Once that they couldn't even recover the costs anymore, that was it... we've got ourselves to thank for it. We all would love to see a new version of NVDI appear.... same reason! And then you guys have the nerves to ask these authors to release their code!! I think, no let's make that I'm convinced that they'll tell you where to stick it.
And it's not only happening to commercial software, ask Didier how many registered Aniplayer users there are, why do you think that the development of PhotoTip was halted?

First we steal it, and when it's not being developed further anymore we want it to be free and open source.... the same thing is happening to HD Driver, one of these days Uwe will be fed up with people ripping him off, I wonder who will be shameless enough to ask him for the sources.
The Newsie code is resting now on the same heap where QED, Chagall, Interface, Cypress and many others are gathering dust. So, like I said, let's talk in a couple of years...

>thanks for offering someone elses help but I'm not interested!
>I'm sure that if Okami is as great as the currnet users say it is then it
>would be more widely used by us inadequate or just plain lazy consumers if
>it were easier to install.

I had to offer someones elses help... I'm not an Okami user. Anyone who knows me a little knows that I'm always on standby to help someone out. If you for example would be willing to start using MagiC, I'll be the first one to get you going with ASH Emailer...
I have tried Okami a couple of times, it's just as good as ASH Emailer, but

didn't really offer anything more either, so I sticked to using what I like best. And yep, you are right. Okami is not the easiest app to set up

>he good lord willing, see you in '06. I'll set my alarm clock :)

That's not necessary, I'll wake you up :-)

Cheers from Belgium
Dennis

Hi Dave,

>not a games machine, and hardly runs any either, thus, boring boring
>boring and the stock video capabilities are nothing to get excited about
>that's for sure.

What's boring about a standard 1280*960 resolution? what's boring about
being able to attach up to 14 different SCSI & DMA devices, Why are 5
serial ports boring? Why is a VME expansion port boring? Why is an easy
expandable computer boring? Why is fast ram boring? Why is the seperate
keyboard boring? etc...

>
>falcon has many games dedicated to take advantage of it.

Really? Would you perhaps care to list them? The whole lot should fit in a
relatively short posting. Or should I ask to define "many" ? LOL
IMO anyone who wants to play *many dedicated" games should focus his
attention on a ST or STE. If he plays a different game everyday, he'll be
busy for at least the next ten years...

Cheers from Belgium
Dennis

Hi Ivan,

>Dont be so rude...

Don't mind about him... he's our local idiot. It's best to not pay any
attention at all to posts posted from the news@greennet.server.

>I'm from Santiago, Chile (South America).
>As you can see, my primary language is spanish, not english, and i'm used my
>mailbox address just in eBay. So .. my mistake... then , my mailbox is in
>Miami, Florida , USA. But i'm from Santiago/Chile.

You really don't have to explain your where abouts here! but hey, welcome
anyway! I had absolutely no idea that there are Atarians in Chile, please
make my day and don't come telling us next that you're about the only one
there!

>Just curious....
>Why the TT is boring ???
>and... is it for sale ? xD

Ofcourse a TT is not boring, Atari never made one single boring machine! Every
computer they made, had some unique features. I think that the TT can best be
described as the "versatile work horse" from the range.
If you're looking for a TT get in touch with me privately I might be able to
help you out.

Cheers from Belgium
Dennis

Well, it's usually just a dialer script for the STinG dialer
application if we are talking Atari here...

On another popular platform it might be a screensaver application or more
commonly yet other executable file that would infect your computer with
some virus... Nothing to worry about as long as you don't try to run it
on a vulnerable OS.

A toast to the brave who rely on Redmond software online!

I just finished a WindowsUpdate session that cured(?) some critical MSIE
security holes. The fact there are still new ways discowered that make it
possible to infect/destroy your computer by simply browse the web is
scary...

That is true about there not being two many titles for the STe,
but the ones that came out really shined. Two bad Atari just did
not release this computer first instead of the regular ST.

I agree here. Mint is a nice way to go and for the most part, it
is free. I have it installed on a separate hardrive and I just
need to install version 2 of N.AES.

Since we're discussing various uses, it is also an extension used for a
FAX image - but as stated, in most cases, it is not something you want to
try to run on a Windows platform.

>supports this format?
>
>Many thanks in advance,
>Markus.

Firstly HI all:)

I've just got my newsreader working again, and so having a waffle
through (trying to catch up).

I havent read all the thread, tut tut, but i thought i'd jump straight
in.

The ST doesnt obey the rules, as far as DOS is concerned, in the boot
sector record. But apart from that it obeys the laws governing the FDC
(floppy disk controller), which also enables a you to format a disk on
your humble ST using 'extended formatting' - in other words more sectors
per track and more than 80 tracks - very handy when you want to move
data across to the other platform.

I dont run any emulators on my (cough) pc's and i transfer all data
between the two formats using scsi drives.

What i do is format the disk on the Atari, if you have a High Density
drive that can have an 'extended format' as well. Then i use a program
called 'DCformat3' to sort out the boot sector so it's MS-DOS
compatible.

I've used floppies like that for ages reading and writing between the
windoze and TOS.

You can also format a disk using windows and i've never had any problems
with any on my ST's reading it. I can remember a few times where the ST
didnt like writing - or should i say that the pc didnt like it after it
had been written to by the ST on a pc formatted disk!!!! Weird one that.

I will have a link back up on LaST PD's web site for the dcformat program when i've replaced the 5 minute throwtogether menu it has at the moment:)

For now the link is www.last-pd.co.uk/programs/dcformat3.zip

A brilliant little program called gem explorer does a very good job indeed. This was with the gemulator package (the expensive one) and had no limitations. They also did a teaser which only allows access/transfer of ONE file at a time, then you had to re-run. Hopefully they may have released the full one in the public domain - even shareware would be welcome.

>
>Thank You
>
>Ken K
>
>
Hiyas

There are several reasons that can cause that error message. You did
what i would have done and tried another drive. Is the drive from the
STF a single sided drive?

If so it's possible that the disk you are trying to read is double
sided.

I would suggest you try and format a disk a few times, with a formatter
that verifies (reads back) the track it has just written - fastcopy 3 or
pro springs to mind.

Disk drives are funny beasts and something simple like a spec of dust
gave me a couple of sleepless nights wondering why a perfectly good
drive with perfectly good heads wasnt working.

Another problem can be dirty heads, not necessarily the build up over
time sort but something that has been transferred from the floppy media
surface itself. Disks are made of the same media as video tape, and can
grow a fungus if storage in the correct conditions. This is usually in a
form of very fine powder that seems to like drive heads. This can cause
erratic reading of the heads as this powdery stuff is moved around and
over the heads - one minute it'll read the other it wont.

Ideally you need to find out if it's the drive or not, try sticking the
drive in the STF and see if you are still getting the same problems.
Likewise for the drive out of the STF, if it's a single sided drive
format it and work with it as a single sided one.

Do you have an external drive (a drive B) or have you recently got
yourself one? I've come across a couple of external drives NOT liking
the internal drive - ok if run separately but not together.

2684. Re: 50 hz boot disk wanted ST 50/60 hz question

Newsgroup: comp.sys.atari.st
Date: 2004-04-17 01:57:49 UTC
From: Steve Stupple <Steve@steverosie.demon.co.uk>
Message-ID: <EUpzm0Kd8IgAFw6h@atari.org.uk>
Source record: 19273

Hi

IIRC the frequency 50/60hz for the ST's alter the monitor output frequency. 60Hz (US) gives a bigger picture (less of a border) and slightly faster speed performance here in the UK. Over here some old tv and monitors dont like anything but 50hz.

By the sound of things it looks like ye olde internal timing and compatibility problems. I have found that running another TOS version - disk based - may also help. I use the original TOS 1.09 on disk for some NON STE software without any problems

I have never really had any problems from software that i have had from the usa, or anywhere in the world come to think of it. Anything that relies a lot on timing can be thrown off with different versions of TOS.

If you can look through my library catalogue, sorry not added search functions to the site yet, you may be able to find the exact program you are after as there are several that change all manor of things at boot time:)

www.last-pd.co.uk

Hope this helps

Hi

There were several games called match it, i tried to get further info on
the site link above but kept getting page not found.... probably my isp
having routing problems again.

The match it i liked was iirc a demo, and had background music that you
either liked or loathed. It was a full working game though. Very easy at
the start but as the time got shorted at later levels, you also had to
think so that you didnt get a stalemate.

Where this was different from the rest is that you earnt helps, if you
didnt need a hint you would gain an additional help credit.

2690. CT60 : what's up ?

Newsgroup: comp.sys.atari.st
Date: 2004-04-17 12:28:56 UTC
From: Rodolphe Czuba <yenamarreduspam-rczuba@free.fr>
Message-ID: <408122fe$0$22849$626a14ce@news.free.fr>
Source record: 19279

I confirm that the PCB are arrived this last week at the assembler
company...
The assembling will begin this week, as soon as the PGA socket of the 060
are arrived at the assembler.
There were some troubles to find then and buy them in a such small qty (80)
and the 18*18 format is a very old model now like the 060.

I confirm too that the 060 arrive next monday or tuesday.

Shipping of the first board should be so at the end of this month...

17 boards still available !

;-))

2691. Official communique about VERNAL ELM

Newsgroup: comp.sys.atari.st
Date: 2004-04-17 12:42:31 UTC
From: Rodolphe Czuba <yenamarreduspam-rczuba@free.fr>
Message-ID: <4081262e$0$22882$626a14ce@news.free.fr>
Source record: 19280

I inform you that Mr Ben Berkowitz, boss of the company decioded to manage himself the affair of my lost 060, and after a long period of troubles & silent for whose the causes seem to be a email & efax routing problem in USA, the dialog is retablished and he phoned me at my home to be sure I receive well his emails... and I appreciate this.

So, I ordered again some 060 to Vernal Elm and Ben decided to send me FREE the 25 CPU I didn't received the last October... A nice and commercial decision I appreciate too.

It seems that Vernal Elm, with the work from his boss, is a serious company that try to solve the problems and that is listening his customers...

This definitively cancels my complains !

Thank You for your attention.

And Thank You to all that tried to help me and were ready to move ...

Rodolphe

The game file is MATCHIT.TOS (others files are others APP)

> The match it i liked was iirc a demo, and had background music that you
> either liked or loathed.

A kind of Japanese music ?

MATCHIT.TOS is the game file, but the demo isn't in the ZIP file (sorry...
somme functions of the game can't be used for this reason :-( )
This game can be run on STEEM Engin for PC :-)

>It was a full working game though. Very easy at

> What's a passive terminator and how do I connect it.

A passive terminator is a small device that attaches to the SCSI in connector on the exterior of your drive's case. It performs the role of "caboose" to your SCSI "train" of devices, although like most modern trains, most modern drives have built-in termination. Your drive is quite elderly, and so may require external termination.

I found the following link and especially the discussion below that
article rather interesting for us.

http://slashdot.org/article.pl?sid=04/04/17/1623200I

Some points can be extended from Amiga to Atari, I think.
Some things (m68k JIT) sounds even close to what ARAnyM does :)

Petr

2703. Re: Atari STe

Newsgroup: comp.sys.atari.st
Date: 2004-04-18 12:04:03 UTC
From: Steve Stupple <Steve@steverosie.demon.co.uk>
Message-ID: <TYS2VyDz6mgAFwZl@atari.org.uk>
Source record: 19292

On Sun, 11 Apr 2004 at 13:26:09 a message from Ivan Barrera A. was created on the subject of Atari STe.
>Hi !
>
>I've lots of atari ST. But no STe.
>Is there any difference i can make with one ?
>Could i install better software ? Easy to install a harddisk ?
>

Hi Ivan

Been interesting reading the thread, hence my delay.

I have lots of ST machines, ST, STF, STM, STE etc. I need to have a machine for testing software out on and so have a large range of TOS versions:)

Imho i would keep an STFM and also get hold of an STE. For game play the STE is slightly faster and the software that is dedicated to it, written for STE in mind, is brilliant. I still reckon Obession is one of the best pinball games around and i've got the pc version (not called Obession, just tried to find the title, i got around 40 pinball games and i cant remember what it's called atm.) and it's not as good.

The Ste - 'e' standing for enhanced. Has a larger colour base, dma 4 channel sound, blitter, enhanced joystick ports (jaguar pad in laymans terms), easily memory upgraded, most are easily Dual TOS upgradable.

There are some drawbacks, especially for game players, some software doesnt like the timing, especially fdc copy protection techneques. Although most can be overcome, hence the reason i suggested hanging onto an STFM. You can also run software based TOS versions which should iron out 99.999.% of compatibility issues.

If you add a harddrive to any system it automatically allows you to use 'better' software, well not really better but efficient software. You dont have to keep changing floppies every 5 mins.

Whether it's easier on the e's is another matter. What is true is the TOS version for the STE's are either 1.6 or 1.62 and they are more geared up for hard drive and the hard drive partition limit is larger.

In the thread there isnt any mention of the Mega STE's - 16mhz, lots of serial ports, vme, 1.44 floppy and looks identical to the TT AND if you can get the SM144 monitor the stand is designed to sit on top of Mste and Tt bases. These, like the TT, are aimed more at the serious side of computing, although most games run on mste's.

Mste run under tos 2.05/2.06.

To be honest you cant call the TT or MSTE boring.

Now the Falcon is another beast altogether, and the current ebay price, like STE's, are starting to rise.

These are the same as STE's but different. They arent one-for-one compatible. So software works well, some doesnt. Games that are made for the Falcon arent bad, some are just quick conversions.

Where the Falcon blows the competition away is it's sound software. Iirc it was another first for Atari being the first production home computer to have a DSP as standard.

I have a Falcon, but dont use it very often. The Mste is a real pleasure to use, but i use my main STE most of the time because most people have STE's and some of the hardware i have wont run on mste's:((((and not having a second floppy port on falcons makes my discovery cart redundant:(

4 channel sound is wrong if you mean "all dma". It is 3 channel YM + 1
single DMA sampled voice. If you don't mind that 3 of the 4 voices are
chip voices, than you have ofcourse 4 ;)

Just to make clear,
Matthias

2706. do not do business with Vernalelm -- RE: Incredible...

Newsgroup: comp.sys.atari.st
Date: 2004-04-18 17:54:15 UTC
From: ech20@columbia.edu
Message-ID: <786f47a2.0404180954.1ba34982@posting.google.com>
Source record: 19295
Cross-posted to: comp.sys.atari.st,comp.sys.amiga.marketplace,comp.sys.amiga.hardware

It looks like some more people got scammed by vernalelm. Well, just to reiterate my post from last summer: do not do business with vernalelm.

This is my post from last summer, detailing my sorry experience with them. I never did get my money back, and that's the last money I spent on my amiga. There must be some legitimate companies left in the atari and amiga markets, but vernalelm is not one of them. They did not respond to the Better Business Bureau complaint, but their website is still there hoping to snare some more people who don't know their reputation. Don't fall for it!

-Eric

From June 2003:

Greetings,

Some of you may have dealt with Vernal Elm in the past and had good results, but it's how a company handles bad situations that proves their integrity. The company sells Moto 68060 cpu's.

The short version: do not deal with Vernal Elm. Especially do not paypal
them any money, as they have shown that if they feel they can get away with it, they will accept the money and not show anything for it. On ebay,
well, they have to deal with building up a catalog of positive feedback. I
have no doubt though that as soon as they do, their unethical practices
will surface again.

The long version: I just filed a complaint with the Better Business Bureau
of Connecticut about their online business. They claim shipping within 48
hours.(incidentally, they charge $6 for shipping, but my cpu was in a reused mailer with a 60 cent stamp on it) After I clicked on the paypal
button, I had to email them 3 times to get them to respond and ship me the
chip. I got it more than 3 weeks after I ordered it. They claimed it would
be a full version. It was clearly marked EC. And. . . it didn't work in my

Amiga 4000 CSPPC (233MHz ver). I swapped out my old chip, stuck it in, and
the machine would't boot. I tried it again, reseated it, and got the same
results. The old chip went back in and it was fine. Well, they also claim
a 30 day refund/replacement guarantee. I email them about it. They take
their time getting back to me (this becomes a pattern). They tell me to
send it back, and I do, on Feb 26th. The package goes unclaimed. I email
again. I send it back a second time on April 2nd, after hearing an excuse
about large packages not being delivered (as if that were believable.)
This time, it IS accepted (at 10:49AM on April 9th: see www.usps.gov
tracking #7002 2030 0005 5261 1831), and after that all contact from them
ceases. I email 3 more times, but get no response. Who knows, maybe
they've ebay'ed it already.

So that's the long and short of it. It's amazing that when a company is
unethical, it starts from the very minor things: cheating on shipping
charges, shipping late, ignoring emails, sending the wrong merchandise,
and finally refusing to honor refund policies. Yes, I know that I should
have stopped trusting them in January, and yes, it IS after 30 days, but
that's only because they WAIT 3 weeks to reply to any email.

NVDI I guess depending on the version should offer all of the
functionality of speedogdos and more.

BIG SNIP

Below also for Rudolphe:

PayPal - What does PayPal say about using their name fraudulantly?
United Parcel service - Does UPS know about the scam?
Postal Service - If mailed bu USPS, mail fraud is a Federal offense!
Better Business Bureau - what's their reply about the scam?
Elm Host - Has Elm's host ISP been notified?
E-Bay - well.....Elm is at home!

sorry to say this Rudolphe but with all the calls, faxes and letters to
Elm, a reply after 1 year is way past being forthright and sounds like a
another stall tactic but hopefully not (I don't mind being wrong here).
When are you supposed to receive the 25?

Is there a way to format a 3 1/2 Floppy Disk on a PC using XP so that I could transfer files to and from a Atari Falcon?

I know there are other ways to do this using CDs, Null Cables and etc. But I'd like to do it with a Floppy if possible.

Thanks,
phantomm@bellsouth.net

No it isn't. I've owned several aftermarket Amiga mice with a switch to
select Atari/Amiga. It is only one wire that is switched so why you think it
is rubbish is beyond me, you clearly haven't a clue on the subject.

>The application can also, in some cases be recompiled for a specific
>processor or fpu. Try that with magic and it's closed source that will
>end up forever lost as the author already stated it will not be open
>sourced.

As a user I don't really care if the sources are open or closed, but how did you manage to get MagiC mixed up in this? I could say the same thing about N.AES 2.0...

>Newsie could be moved to another processor family if such a thing
>appeared.

Sure it could...
That's exactly the stuff potential buyers of a Coldfire or PPC clone are waiting for. I always assumed that one learns from his mistakes, but on this platform? One of the reasons that the Milan project failed was the lack of apps specifically written for it... and now you come telling us that people should be content with recompiled crap?
I can see the qeue lining up to get that clone....

>Newsie in it's present form has an edge over magic in this regard. From
>a technical standpoint newsie was made future proof simply by going open
>source. Sure it requires someone to do the work, but again the
>possibility is there.

No one expects MagiC to become open source in the first place, not even you, but it's a nice argument to use in discussions like this of course. Also, supposing that a new clone would be a success (number wise), then it wouldn't be a very large job for the programmer to adapt it. You overlook the development that went into MagiC when MagiC-Milan was developed, the way it's now, porting it over and ensuring that it recognises all the new stuff in the computer (PCI, graphic card, etc) is relatively easy.

>I am not saying newsie is a better app than magic, although it's a toss
>up which one trashed more partitions.

I guess I'm just a lucky fellow. I started using KAOS TOS back in 1987, followed by MagiX! and then MagiC. Without a shadow of doubt some of my grey hairs are caused by using this OS. But one thing it never done here is trash partitions...

>But realistically open source hurts no one, and anyone arguing against it
>simply has a defeatist attitude.

In certain circumstances it can hurt...
Take for example RSC editors/construction apps. These kind of apps are only used by a very small minority of users. When Interface was abandoned and later became open source, it indirectly hurted the sales of RSM from Armin Diedering, who after some time as a direct result of this halted the development. So what we've got now are two quite very good apps that both are not supported anymore. The question to ask is who wins here? And of course also who looses out.... :-/ From where I am sitting it's me the user who looses out! Interface although it is open source now lies there idle, and the few users that use these kind of apps are quite happy with it, probably because they can't look further then their nose... RSM which had a "to do/implement" list of at least a mile long, is now laying there idle also... thank you very much open source, you really helped us move forewards!!
Do yo think it's pure coincidence that the development of Smurf was halted shortly after Chagall became open source and PixArt public domain? If you do think again!
How's that for a defeatist attitude?

Cheers from Belgium
Dennis

Message-ID: <1082398922-61443AEicMi@gmx.net>
Source record: 19209

Hi John,

> but always return back to the one that's originally supplied with it.
>
>Indeed! Can you send me that OVL? From what I recall it didn't work if
>you didn't have a multi-tasking OS. Dan's OVL works well here with "single"
>TOS 4.04

The CAB IConnect OVL comes supplied with CAB, so you already have it. But it will only work under MagiC. IConnect is the only app AFAIK that uses MagiC's multithreading so it won't function with MiNT either. I never said that Dan's OVL doesn't work well, but it's easy enough to compare... and then there's a difference between "working well" and working excellent" also of course.

>>I must have written this a thousand times by now.... use CAB with IConnect
>>and the Iconnect OVL and be pleasantly surprised.
>
>Again, Iconnect with TOS 4.04 , no Magic?

No, not under SingleTOS ...
For heaven sake John! Take a look at the manual that comes supplied with CAB, search as long as you like, but you will not find a reference even mentioning TOS or singletasking. CAB is ment to be run under multitasking. The fact that some people found a way around this, doesn't change much. CAB can of course run under TOS using STIK/STiNG and a OVL programmed for it, but you loose a lot of functionality. The IConnect stack is on average 20% faster, and like already mentioned the OVL is a lot better also. If you want to use the program different then it's intended to... that's up to you of course, but you must realise that it'll only give it's optimum performance under MagiC, using IConnect and the IConnect OVL.

>>BTW what's up with HSMODEM? AFAIK it does all it promises to do: speed up
>>the serial ports....
>>
>Others have mentioned bugs or deficiencies and the author intended to
>put out an 8 version (way back when)

Others? Personally I never encountered a problem with HSMODEM, it's there in the background doing whatever it is that needs to be done. Have you experienced these deficiences and bugs yourself?

>so I misunderstood that your coment was directed at John for releasing
>the source code?

Yes.

>I did mention ASH above. Should we consider ASH programs as "crap"?

That is a very tricky question.... :-)
To answer it, the first thing we must do is define the word "crap". I for example refer to apps as crap when they don't do what is stated or promised by their author. And apps which loose data, take down the system, are responsible for partitions being fucked up, do not use GEM etc are put in the same class. Remember! that's my definition of crap... You can say that I'm biased, but *none* of the apps that ASH distribute fall in any of the above mentioned categories. So from where I am sitting, no, they're definitely not crap.
And I'll take it even further: until today, not one of the ASH apps has been matched, none of the contenders as far as there are any come even close. I've been reading the silliest claims here the last couple of years, but until today nothing has appeared yet that comes even close to i.e: Texel, Phoenix, Jinnee, Artworx, Papillon and the rest of the long list...

But let's face it, if one of these apps would receive the open source status tomorrow, they would still be as dead and unsupported as they are today. On a platform with millions of users, open source can be a blessing, but on this platform however it's just hype.

Also, the only ASH app is CAB, all the others are distributed by ASH. There's quite a difference...

>>And it's about time we face it: the **only** reason why CAB is not further
>>developed is theft.
>
>so you're implying that there's little theft of the MAC version? I don't know
>if the MAC version is still being upgraded but it was after upgrades of the
>Atari version was dropped.

Not at all!
After five years of development iCab is still in beta phase, anyone can download it and use/test it for free. Users who like it and would like to support the author can pay for it straight away, once (if ever) it's out of beta, these people will be automatically be registered users. So, no one is stealing anything.
BTW, there is some confusion here about the development of CAB, the last couple Atari upgrades of CAB were teamwork, several of the ASH programmmers chipped in and improved it. Alexander Claus has nothing to do with versions 2.6, 2.7 and 2.8. The OVL is not his work either, just like all the bug fixes some new feautures and some of the supplied modules.

>>Someone at ASH once told me once how many versions of
>>CAB that actually have been sold... I was stunned, and it's not only CAB,
>>but about the whole ASH catalogue. Once that they couldn't even recover the
>>costs anymore, that was it... we've got ourselves to thank for it.
>
>your omitting those who went to different platforms (some due to the lack
>of bug fixes or upgrades).....vicious cycle!

No, not really. If every existing Atari user would have a legal copy, then CAB would probably still be supported. And this doesn't only apply to ASH apps. A lot of apps which are now "orphaned" could have been saved, if the users had a different attitude.

It's too easy to blame the people that left this platform. I assume that at least 8 out of 10 people use CAB, not to mention for example HD Driver, which is probably used by 9 out of 10 users. Meaning that Uwe Seimet in **theory** wouldn't have much to complain about, in practice however... Suppose he would be fed up tomorrow and stops further development, I really would like to see the guy that has the nerves asking him to make it open source.

>>The Newsie code is resting now on the same heap where QED, Chagall,
>>Interface, Cypress and many others are gathering dust. So, like I said,
>>let's talk in a couple of years...
>>
>
>agreed! You're probably right about open sources being neglected

It's not "probably" John, it is like that. And the next question to ask yourself is why they are being neglected... Let's assume for example that tomorrow Calumus, Papyrus, Texel, NVDI, Jinnee, Tempus Word NG etc would be released as open source. I'm convinced that it wouldn't take very long before someone picks up the code and maintain it to our benefit. The difference between those apps and Newsie should be obvious. They still have a major group of users, and they represent the "top" on this platform. Apps like Newsie however died a slow and painfull dead... they had a funeral and were burried, giving them a new status is like digging them up.... but who the hell is interested in a stinking rotten dead corps?

>>That's not necessary, I'll wake you up :-)
>
>either use something loud or send a female (no sheep from Steve) :)

I'll just shout, I'm rather good at that ;-)

Cheers from Belgium
Dennis

Well, actually for me Signum! word processor was the weakest of the ASH
applications. Yes, it was feature packed, but still quite far from Papyrus,
not to mention that it uses its own GUI, not based on GEM :-)
Otherwise we can of course argue whether MiNT is better than Magic (in fact
it is - featurewise) - but the fact remains - ASH has done great job
supporting Atari system for many years and BTW - Magic is simply better for
most users just because it is simplier to install and mantain. I have just
tried to install MiNT using EasyMiNT installer, but despite my long computer
experience and reading supplied docs carefully it didn't work - it started
with few dialog-windows, but unfortunately not even single character
appeared in them - there were no such a stupid problems with Magic :-)

Yes just do a normal format in XP! Your Falcon should have a HD floppy
drive and will read the disk just fine. If it doesn't you probably have a
bad drive, heads are dirty or you have a Double Sided drive and will need
format to 720k.

Source record: 19215

I know this is an old topic, but with the recent interest in Pegasos (mine, too!) I thought I'd bring it up again.

What would it take to turn a PPC machine (Pegasos or Power Mac) or a peecee into an Atari? Not an emulator, but the OS and applications running natively on the non-M68K platform? Think "linux", how the OS and applications are all source distributions that are compiled to run natively on a variety of platforms. How close is the Atari world to being able to pull that off?

Am I right? -> We need BIOS/XBIOS/GEMDOS running in x86 machine code talking directly to the basic set of peecee hardware, and AES/VDI running on top of that, and MiNT and/or a suitable desktop (Teradesk?) running on top of that, and the basic set of applications running on top of that.

EmuTOS is BIOS/XBIOS/GEMDOS, is it not? Right now, it is intended to run on top of an emulation layer, such as ARAnyM. I've taken a quick peek at EmuTOS; it is mostly C-code with some M68K assembly that could probably by ported; this is perhaps the "arch" layer.

How portable is fVDI? Peeking at the version shipped with ARAnyM, there is a fair bit of assembly, but it is all/mostly short subroutines.

Do we have a maintained open-source AES, like oAESis? How portable is MiNT?

I know this is a lot of work, with too few hands, but as well as ARAnyM is doing, it is _still_ "just" an emulator, and while I appreciate the work Rudolphe is doing with CT60, and rumors of Atari ColdFire, the only real path forward for Atari is Intel(ish) and PowerPC.

Or is it really even feasible? Is emulation the _best_ we can ever really do, even theoretically, given the design (or lack of it) of the core Atari SW to depend so heavily on the underlying hardware architecture?

2727. CONGRESS SHOULD BEGIN IMPEACHMENT INQUIRY OF BUSH AND CHENEY

Nader: Iraq an Unconstitutional, Illegal War

Based on Five Falsehoods:
CONGRESS SHOULD BEGIN IMPEACHMENT INQUIRY OF BUSH AND CHENEY

"All public policy should revolve around the principle that individuals are responsible for what they say and do." -- George W. Bush, 1994.

Washington, DC:
Building on his call for the impeachment of President Bush and Vice President Cheney, Independent Presidential candidate Ralph Nader today is calling on Members of the House of Representatives to begin an impeachment inquiry to investigate two distinct impeachable offenses.

An Impeachment Inquiry is the first step toward considering Articles of Impeachment. During an Impeachment Inquiry the House would investigate whether there are potential impeachable offenses.

Impeachment Inquiry and the Process of Impeachment

While the Constitution is clear in granting the impeachment power to the House, it leaves the development of mechanisms for exercising the power to the House. As noted by the Association of the Bar of the City of New York in "The Law of Presidential Impeachment By the Committee on Federal Legislation" (see: http://www.abcny.org/presimpt.htm):

"A variety of methods have been employed to institute impeachment proceedings: Charges may be made orally on the floor by a Member of the House; a Member may submit a written statement of charges; one or more Members of the House may offer a resolution and place it in the legislative hopper; a presidential message to the House may initiate proceedings. The House has also received charges from a state legislature, from a territory, and from a grand jury. Finally, there may be a report of a committee of the House which may submit facts or charges that will lead to impeachment. Under the rules governing the order of business in the House a direct proposition to impeach is a matter of highest privilege and supersedes other business. Similar privileged treatment is given to propositions relating to a pending impeachment."

The purpose of the Impeachment Inquiry is to have a Committee develop a report for the House which then can be considered for the purpose of determining whether to proceed with impeachment proceedings. The House

determines whether to impeach based on a majority vote. It is important to remember that impeachment does not mean conviction - that is left to the Senate. Impeachment is the equivalent of an indictment, making formal charges, which the Senate then considers. Conviction requires two-thirds of the Members present in the Senate to vote for conviction.

Two Potential Articles of Impeachment that Should be Part of an Impeachment Inquiry

The Impeachment Inquiry should focus on two areas involving President Bush and Vice President Dick Cheney.

The unconstitutional war in Iraq.

"The Inquiry should examine whether President Bush and Vice President Cheney have gone beyond the bounds of the Constitution, defied the rule of law, and if so, whether impeachment is the appropriate constitutional punishment," said Nader. The United States Congress never voted for the Iraq war. Congress voted for a resolution in October 2002 which unlawfully transferred to the President the decision-making power of whether to launch a first-strike invasion of Iraq. The United States Constitution's War Powers Clause (Article 1, Section 8, Clause 11) vests the power of deciding whether to send the nation into war solely in the United States Congress. This can only be changed by a constitutional amendment.

"Our founders had seen what could occur when the power to declare war was vested in one person, a King or a Queen, so they took clear steps to ensure no one person could declare war for the United States. As James Madison wrote: "In no part of the constitution is more wisdom to be found, than in the clause which confides the question of war and peace to the legislature, and not to the executive department," noted Nader.

Five Falsehoods that Led to the Iraq Quagmire:

Making matters worse in this situation, the illegal first-strike invasion and occupation of Iraq was justified by five falsehoods. Nader calls for a second area for Impeachment Inquiry to examine: the "five falsehoods that led to war." In 1994 George W. Bush said: "All public policy should revolve around the principle that individuals are responsible for what they say and do." In 2000, he ran as the "responsibility " candidate. Manipulation or deliberate misuse of national security intelligence data, if proven, would be "a high crime" under the Constitution's impeachment clause. Article II, Section 4 of the Constitution provides: "The President, Vice President and all civil Officers of the United States, shall be removed from Office on Impeachment for, and Conviction of, Treason, Bribery, or other high Crimes and Misdemeanors."

WEAPONS OF MASS DESTRUCTION.

The weapons have still not been found. Nader emphasized, "Until the 1991 Gulf War, Saddam Hussein was our government's anti-communist ally in the Middle East. We also used him to keep Iran at bay. In so doing, in the

1980s under Reagan and the first Bush, corporations were licensed by the Department of Commerce to export the materials for chemical and biological weapons that President George W. Bush and Vice President Dick Cheney later accused him of having." Those weapons were destroyed after the Gulf War. President Bush's favorite chief weapons inspector, David Kay, after returning from Iraq and leading a large team of inspectors and spending nearly half a billion dollars told the president :We were wrong."

See: David Kay testimony before Senate Armed Services Committee, January 28, 2004.

IRAQ TIES TO AL QAEDA:

The White House made this claim even though the CIA and FBI repeatedly told the Administration that there was no tie between Saddam Hussein and Al Qaeda. They were mortal enemies - one secular, the other fundamentalist.

SADDAM HUSSEIN WAS A THREAT TO THE UNITED STATES:

In fact, Saddam was a tottering dictator, with an antiquated, fractured army of low morale and with Kurdish enemies in Northern Iraq and Shiite adversaries in the South of Iraq. He did not even control the air space over most of Iraq.

SADDAM HUSSEIN WAS A THREAT TO HIS NEIGHBORS:

In fact, Iraq was surrounded by countries with far superior military forces. Turkey, Iran and Israel were all capable of obliterating any aggressive move by the Iraqi dictator.

THE LIBERATION OF THE IRAQI PEOPLE:

There are brutal dictators throughout the world, many supported over the years by Washington, whose people need "liberation " from their leaders. This is not a persuasive argument since for Iraq, it's about oil. In fact, the occupation of Iraq by the United States is a magnet for increasing violence, anarchy and insurrection.

Nader urges the Congress to investigate the illegal nature of the war, and how the five falsehoods became part of the Bush Administration's drum beat for war, in a formal Inquiry of Impeachment.

have also signed or endorsed the statement. NION organizes marches and other protest activities in its support.

However, Not In Our Name is deeper than the latest academic babblers and limosuine liberals. NION professes peace, yet it is involved - directly as well as indirectly - with terrorist organizations and anti-American propaganda campaigns headed by fanatical Communist and Muslim groups. NION has cemented alliances with bona fide radical organizations like the Interreligious Foundation for Community Organization, Women's International League for Peace and Freedom and the Revolutionary Communist Party.

Not In Our Name: What is IFCO?

Not In Our Name (NION) requests donations on its website, yet on this site donors are asked to make checks payable to NION/IFCO. IFCO is the acronym for the Interreligious Foundation for Community Organization. NION states that the " Interreligous Foundation for Community Organization (IFCO). is our fiscal sponsor." Fiscal sponsorship by IFCO means Not In Our Name receives donations that are tax deductible because of IFCO's 501c(3) (charitable, federal tax-exempt) status. IFCO charges a fee for this service.

Why is NION not a 501c(3)?

Donations to NION/IFCO are then mailed to the Women's International League for Peace and Freedom (WILPF), which is located at 339 Lafayette Street in New York City. The address is the same as NION's. The intimate nature of a financial partnership shows how closely aligned these two organizations are. And that's scary, because the Women's International League for Peace and Freedom has been associated with Communist cau

afaik rodolphe speak about pegasos
(even on fr.c.s.a)

and if we have asm convertor

Optimized 680x0->PowerPC source level assembly
porter and powerful 680x0 backwards compatible PPC assembly language for
the Amiga platform.

http://coyoteflux.nl/ppc680x0.htm

so lets port our atari stuff to ppc. instead of using emulation
we could ask if those amiga peeps want to help us, bye porting this
convertor to atari. then programmers can start making atari-ppc programms,
before the ppc is arived

Source record: 19218

Hi!

I've been thinking about that quite some time.... However I think about it as about what do we really want to keep.

There are two kinds of applications there, first the open-source applications that we can rebuild whenever we would like (have enough motivation) and second there are the old apps that are effectively unsupported.

Assuming we all don't want to dig deep into the OS kernel (like I quite enjoy in the FreeMiNT's case) we just need to run all the existing apps somewhere.

New apps beeing ported are facing more and more problems regarding the OS features like virtual memory, shared libraries, threads etc. I tent to think that if we want to turn our systems to be up-to-date featured OS running all the things we like then we need to change the underlying OS architecture (or implement the missing pieces which is unlikely). For changing the kernel say to BSD one we need to maintain the BIOS/XBIOS/GEMDOS/VDI/AES calling conventions which are not acceptable in a decent architecture (they are comming from a single tasking TOS, you know). There are some chances now to change this API for the newly appearing VDI and AES implementations, however. Once we change these bindings we can port the VDI/AES virtualy to any OS we use. The BIOS/XBIOS/GEMDOS are not really needed, because the OS kernel we would use does already have a replacement. We can create a dynamic library with a compatible API on a programing language level.

Still there is no good enough way to support the old apps in this scheme for which we would allways need to run the emulation layer to fullfill the TOS-like bindings requirements.

Now....

Taking the fact that there are about 150 platform users all over the world - guessing from the fact that Rodolphe can't sell more CT60's recently which is an absolute need for a non-gaming user the key questions are:

* Who would ever use this new VDI/AES like OS?
* If there are enough users who would write/port new apps to that and _debug_ them?
* Do people care nowadays?

best regards

STan

It can be ported, of course (Martin has always been rewriting parts of original assembler code to plain C to ease the possible port) but I don't think it makes any sense. Once you port it to a particular hardware platform you basically tie yourself to that hardware. Why would you want to do that when the hardware is being developed so quickly today? Intel x86, AMD64, PPC and who knows what else will come in near future. Why would you want to lock yourself say into PPC when the AMD64 maybe cheaper and better for other users? ARAnyM frees you from locking to any hardware platform and I consider that to be a great advantage.

> How portable is fVDI? Peeking at the version shipped with ARAnyM, there
> is a fair bit of assembly, but it is all/mostly short subroutines.

There is another VDI being developed that should be more portable.

> Do we have a maintained open-source AES, like oAESis?

almost yes - XaAES. And there is also myAES but I am not sure if it's open-source.

> How portable is MiNT?

well, this is a good question.

> I know this is a lot of work, with too few hands, but as well as ARAnyM
> is doing, it is _still_ "just" an emulator

I think that ARAnyM is doing the right thing here. The software world is trying to abstract from certain HW architecture. Do you know Java, C# with the whole Microsoft .Net architecture and the other bunch of scripting languages that are so popular today? People are bored by binary programs. They want portable solutions working everywhere. Now if you think about ARAnyM as the runtime system that allows you to run your good old TOS/GEM applications on any computer you might understand why I believe ARAnyM is the right way for prolonging the life of remaining active TOS/GEM users. And it even answers your question in the subject: "peecee or PPC" - the answer is "either or both, with ARAnyM the hardware doesn't matter".

Surprisingly related comments are also here:

Full ACK.

I think the charm of Atari OSes is tightly coupled to their simplicity and
to the underlying hardware aspects.

Computers in general tend to become faster and faster, the evolution of
hardware architectures has very short circles, so why not try to decouple
from that by a virtual machine like ARAnyM? The VM settles upon a "BIOS"
(Linux kernel f.ex.) developed and maintained by others, so the few
programmers on our platform do not have to take up with Goliath.

And as one can see from ARAnyM it is even possible to hide the underlying
"BIOS", you can directly boot into your VM.

Regards,

Alexander

The problem IMHO is that a lot of things which should be system level and never should have to have been sold aren't. Extendos, HD-driver, NVDI, and various other system tools probably in all likelihood should be free, they should have been bought by Atari and included with TOS as part of MultiTOS. With most systems, you can depend on system apps being bundled. For instance, you go out and buy a cdwriter and Roxio CD Creator or Nero is bundled. Forcing all the owners of cd writers to have legal copies of the software helps to defray costs and eventually it becomes negligible. If windows needed external software to make it's video subsystem even useable, or another piece of external software to let you handle basic fetures like scsi bus arbitration people would scream bloody murder.

More or less, this is all shit that should have been bundled with the computer to begin with. If it was, maybe people would actually be able to stomach the concept of purchasing all the other apps like Texel or a word processor etc. But how when they spent so much money just building a base system with appropriate licenses.

Just as well for today, there perhaps should be a systems bundle, which comes with a slew of apps like HD-driver, nvdi, etc for around $100. Include MagiC and it costs $200. If things were a bit more straightforward I think there would have been a lot less piracy.

But one thing we can agree on, I have no question that piracy has directly harmed Atari computing severely. The power without the price thing might have led people who generally don't have money or don't want to spend money to our platform ;-)

That's my $.02

NVDI 4 is mucho better than Speedo as bundled with Atari Works!
Faster, speeds up overall VDI, supports more font-types, likely more printers
too....
In some respects NVDI 4 is maybe even better than version 5.
Since you have it...go with NVDI!

Hello everyone

I consider everyone in this group an Atarian at heart, and a friend because we are Atarians. I'm not out to tick anyone off or offend anyone. And if I have a tendency to ask a lot of questions.......it's because I'm the only Atarian in this area, and I don't know of any in the surrounding areas either.

So, the newsgroups and forums are as close as I'm able to get to having Atari friends.

Thank you and good night.

Okay, this is the core of the question.

I'm going to reveal a bit of my ignorance. MiNT does NOT use the built-in BIOS/XBIOS/GEMDOS, does it? It's my understanding that TOS (and in particular EmuTOS under ARAnyM) is used by MiNT only for booting. Once running, MiNT runs independently and in full control of the hardware, in pretty much the same way Linux boots from the peecee BIOS and then ignores it. So all this modern OS stuff you mention, like virtual memory, shared libraries, threads, etc., would be built into MiNT (if it is not already). MiNT becomes the modern OS, and the driver set you build/select when installing MiNT is appropriate to the hardware platform you are using, in exactly the same way as linux.

The BIOS/XBIOS/GEMDOS stuff can remain however friendly or unfriendly they may be to multitasking, since they would only be used in the case of someone wanting a system that boots quickly and runs simple, unsophisticated applications - exactly the case of DOS on the peecee, which still supports a thriving community.

This is actually one of my keen interests in the question. An ST boots very quickly into singleTOS and can load and run a TOS or GEM app in much less time than even a hot peecee can boot linux, not to mention starting ARAnyM. But hot peecees are not cheap, and by the time you add a Link or IDE adapter and even an old hard drive, an ST is not exactly cheap, either, and certainly not "stock". A new Atari OS that boots into singleTOS on an old 486sx gets you a fast-booting machine that's practically free. A new Atari OS that boots into MiNT on a hot peecee gives a great migration path for the community.

>Still there is no good enough way to support the old apps in this
>scheme for which we would allways need to run the emulation layer to

>fullfill the TOS-like bindings requirements.

The model of the transition of the Macintosh comes immediately to mind. The new OS is native PPC, but old M68K binaries can be run via an emulation layer. The work on ARAnyM could be adapted to this role. Yes, it IS an emulation layer, but in _this_ scenario, the emulation is on top of a real Atari OS, rather than masking the underlying foreign OS.

>Now....
>
>Taking the fact that there are about 150 platform users all over the
>world - guessing from the fact that Rodolphe can't sell more CT60's
>recently which is an absolute need for a non-gaming user the key
>questions are:

I think the people buying CT60s are (a) Falcon owners who (b) want more out of their "pure" Atari (TM) hardware and (c) don't mind spending money on the admittedly dead-end M68K technology. My hat is off to them, and to Rodolphe. How representative is this of the community? Not sure...

>* Who would ever use this new VDI/AES like OS?

Anyone who is not religiously committed to the original, pure, M68K Atari (TM) hardware, and doesn't mind committing a peecee (or bootable partition) or PPC machine to a free, open-source _ATARI_ OS to run either original M68K binaries (via emulation layer) or portable source-based applications. Also, anyone who wants better performance than the pure Atari hardware is capable of, and would prefer a real Atari OS to an emulation running on top of a generic OS.

>* If there are enough users who would write/port new apps to that and
> _debug_ them?

I think the main problem now is potential Atari developers who are put off by the futility of supporting a dead-end hardware platform. It might be interesting to do a poll of existing Atari developers who would support both platforms. Or really, if they are already coding their work such that it would already be portable. I don't think there would be _fewer_ developers than there are now. And I think a viable system (rather than just another nostalgia emulator) might attract some outside attention. In fact, another interesting poll is how many developers are interested in developing M68K applications for ARAnyM - or any other emulator.

But like the MiNT people are fond of pointing out, a lot of Unix apps are easily ported to and debugged on MiNT. This can only increase if MiNT is running on a more mainstream hardware platform.

>* Do people care nowadays?

Depends... on how much attention this thread draws :)

It might prolong the life of the users of the "good old TOS/GEM"
programs, but it doesn't do much for developers of _new_ TOS/GEM
programs who would like to do better than M68K binaries produced from
outdated toolsets. "With ARAnyM the hardware doesn't matter", because
the emulated hardware is still an obsolete M68K platform.

>The VM settles upon a "BIOS"
>(Linux kernel f.ex.) developed and maintained by others, so the few
>programmers on our platform do not have to take up with Goliath.

I think any hypothetical Atari developers should certainly leverage the
work of the Linux device driver people.

>And as one can see from ARAnyM it is even possible to hide the
>underlying "BIOS", you can directly boot into your VM.

But you are really just starting an emulator running on top of a foreign
OS. I want to boot an Atari OS!

But in all fairness to you ARAnyM developers, there was/is this
underlying whisper that ARAnyM _will_ become native at some point in the
future, but that whisper has been all but shouted down in the drive to
get this running under linux. At such time that ARAnyM _becomes_ a
flavor of linux running its own VDI, rather than just another emulator
running under X, and the M68K emulation layer for old programs is
invoked only for old programs and leaves natively developed GEM
applications to talk directly to the OS, then ARAnyM will be the native
Atari OS I'm thinking about!

I think most users would like to see new platform. And it could be
PowerPC, as most users voted in this poll:
http://www.atari-users.net/modules.php?op=modload&name=NS-Polls&file=inde
x&req=results&pollID=8
According to Rodolphe Czuba some people in France already work on
porting Atari OS to the cheapest and most modern PowerPC platform -
Pegasos.

I think this is not the case with open source OSes. Take a look at linux
and other unix clones. They are available for many platforms and porting
work was usually made by just a handful of programmers. It could happen
to MiNT too. With some efforts this really good OS could be ported to
PowerPC platform and maybe for Intel too :-) All that is needed is a
kind of bootloader that would run MiNT directly.
ARAnyM is a very good product but it is still emulator - much like UAE
(Universal Amiga Emulator), which is available for many HW platforms
(even for Pegasos - to run old Amiga games :-)

Hi!

Sorry, but I can't stand watching your closed eyes... OPEN THEM and look
around!

Linux is beating the world and has great user base. Do you think that
the same think is feasible with say 200 people? There are maximally 5
developers that are 'active' FreeMiNT kernel develepers.

As you wrote in another mail "most users would like to see...", but
there are not enough of them in total, sorry.

STan

First, what outdated toolsets you mean? We have the up-to-date GCC and its toolchain.

Second, show me the developers that want to "do better than M68K binaries". I want to see them. Want to ask them "what binaries are you going to produce and support? Will you still support old Atari user base or are you going to be PPC only? Or x86 only? Or AMD64 only? Or all? How are you going to support these architectures? Are you going to buy all the hardware? In all flavors? How about different graphics? What sound drivers? How about printing architecture?" etc. I want to hear it. Who will port NVDI to these platforms? Or is there a new VDI with same capabilities? Or are you going to run 80% of your system tools emulated, only the kernel and the few HOT applications will be 'native'?

Guys I don't believe that producing non-m68k GEM binaries makes any sense. If it ever happened it would basically divide the remaining few users - you'd tell them "upgrade to our new APC/Pegasos/whatever or die" and I bet most of them would choose the latter (and abandoned the few apps in favor of microsoft or linux new ones).

> But you are really just starting an emulator running on top of a foreign
> OS. I want to boot an Atari OS!

Atari OS? http://www.atari.com/ ? Last Atari OS is MultiTOS 1.09. You don't want to boot that, do you?

> Atari OS I'm thinking about!

See above what I think about your "natively developed GEM applications"

Hi!

> I'm going to reveal a bit of my ignorance. MiNT does NOT use the
> built-in BIOS/XBIOS/GEMDOS, does it?

It does. But in theory it need not, but it would most probably be hard
to keep the high level of Atari HW support it has because of that.

> BIOS and then ignores it. So all this modern OS stuff you mention, like
> virtual memory, shared libraries, threads, etc., would be built into
> MiNT (if it is not already). MiNT becomes the modern OS, and the driver
> set you build/select when installing MiNT is appropriate to the hardware
> platform you are using, in exactly the same way as linux.

But there is not enough people that would really do that and be able to
debug that all.

> The BIOS/XBIOS/GEMDOS stuff can remain however friendly or unfriendly
> they may be to multitasking, since they would only be used in the case
> of someone wanting a system that boots quickly and runs simple,

> which still supports a thriving community.

I don't run DOS apps anywhere and if I would I would choose some
emulator for that for sure. I don't want to install it definitely.

> This is actually one of my keen interests in the question. An ST boots

150 users. Great. Now let's estimate that at the time the new platform is finished there is at least half of them still around, that is 75. Now let's make another poll - are you 75 guys going to buy the $1000+ new machine when there is no software available, apart from maybe ARAnyM that allows you running your old apps emulated? No? You want some software first, right? OK, but we need developers that would write the software. Port whole FreeMiNT (who will do that?), write device drivers. Finish a VDI to NVDI 5 compatibility level (a tough job). Finish an AES to conform to MagiC standards. And start writing applications. Building those that have plain C source code is a piece of cake (almost), but what to do with those that are partially assembler based, or those that were written for PureC? We need more developers. They have to buy this new platform first. Or is somebody going to buy it for them? Who? And why? Anyway, if they happened to get the machine, would they be willing to spend days or weeks on porting the software for 75 potential users? And what if those users don't buy the machines in the end? Months or years of useless work.

Come on. Don't break the binary compatibility. M68K is a good instruction set. We know it well. Why abandon it? Look at the wintel world - they pay so much attention to binary compatibility for more than 20 years already. Even the latest AMD64 CPUs are still backwards compatible with the 25 years old CPUs. Why do you think they do that?

sigh No, just never needed it for anything. All I "might find" is an animation of a floppy going into a drive, I couldn't be bothered to find out and install all the stuff I needed to get it going, not because I have anything against Amigas but just because I don't have any use for it at all.

My first girlfriend had an Amiga, I had no problems with it apart from the ugly GUI and the unstable desktop.

Maurits.

Petr - FYI - MorphOS (AmigaOS clone for Pegasos) was created mainly by
just a handful ex-Phase5 (company that produced CPU boards for Amiga)
programmers. And MorphOS is able to run both - 68k Amiga software
directly from system (it has built-in fast JIT 68k compiler) and new PPC
native one. Very similar to MacOS, which could run 68k software since
first PowerPC machines. AFAIR on just 604e/200 68k code was running
faster than native on 68040/40.

Well, but they have their fully compatible CPUs still developed, while
68k "died" many years ago with the last 68060.
Petr - I really appreciate work that has been done with Aranym. But I am
afraid it will end up as the best Atari emulator - just like UAE did for
Amiga.
And speaking of compatibility - I confess that I have tried only MacOSX
version running on G3/400. Photoline FPU version) crashed Aranym
totally, Calamus (both 95 and 2003 Light) had problems with colour
picking. I hope it is better on PC Linux, and if yes I hope future
releases will be equally compatible no matter which platform it is used
on. Otherwise it can't be called "Atari running on any machine" but
rather "Atari running on some machines" (no offence :-)

Sounds great. Handful. But developed since 1999. And its price is hidden
in the PegasosPPC machine which is available for $1500. Now get back to my
questions above. They (MorphOS) have more than 1000 registered developers
(or were they users, I don't know)... How many atari users? 75?

> Well, but they have their fully compatible CPUs still developed, while
> 68k "died" many years ago with the last 68060.

ARAnyM could change that (could be your compatible CPU) if users would
agree with this idea of a virtual machine.

> on. Otherwise it can't be called "Atari running on any machine" but
> rather "Atari running on some machines" (no offence :-)

I agree. Few developers, mainly with linux, lukewarm acceptance in the
target audience, disappearing interest. Bugs on platforms without active
developers don't get fixed, that's natural.

And besides that, I forgot to upload the bugfixed PPC version. My fault.

Nah, the cheapest Pegasos II mainboard kosts about 400$ - you can put it
in ATX case, add ordinary DDR ram, ATI Radeon card, UltraATA HDD and CD
and all should cost in this case about 600-700$. This is not too much
even by PC standards, is it?

> Now get back to my questions above. They (MorphOS) have more than 1000 registered
developers
> (or were they users, I don't know)... How many atari users? 75?
You are right - they have much more developers (and of course users)
than Atari world. But we've got to know how many retired ex-Atari
developers would be interested in comeback and writing software for new
platform.

> ARAnyM could change that (could be your compatible CPU) if users would
> agree with this idea of a virtual machine.
As you can see it is difficult to convince people that ARAnyM is rather
virtual machine than emulator. ARAnyM is very similar in what it does to
UAE - the latter one is directly called by its developers "Emulator".

> I agree. Few developers, mainly with linux, lukewarm acceptance in the
> target audience, disappearing interest. Bugs on platforms without active
> developers don't get fixed, that's natural.
I could help you if only I would be a developer :-(However I am not.
All that I can do is to test ARAnyM with various PPC configurations and
Atari applications.

> And besides that, I forgot to upload the bugfixed PPC version. My fault.
Actually Francois has sent me a link to new MacOSX version. And I
managed to run it under Panther 10.3.3 - and it was quite a pleasure to
run Atari with MiNT on Mac :-) However a few programs that I have tried
were not working as I would like it to. I hope future releases will be
better in this regard.
Petr - ARAnyM is a very good idea - and your team made hard work to
create it. But there is still quite a number of users that would like to
hav something unique - computer that the could say "it is machine
running Atari software natively" - thus results of mentioned before by
me poll. Keep up good work - ARAnyM is very good - althought not for all.

> the above mentioned categories.

Just notice: Magic (legally bought) crashed 2 times during boot time, no
other apps on me (plain falcon, 14mb ram) and i ended up with wiped hard
disk, once even with crapped MBR... Respond from ASH (dont know who really
replied) was "we are aware of this bug"... Once reason was "Fatal Gemdos
Error" and 2nd time it was "System overwritten"..

So much about bias....

>been reading the silliest claims here the last couple of years, but until
>todayï¿½ï¿½nothingï¿½hasï¿½appearedï¿½yetï¿½thatï¿½comesï¿½evenï¿½closeï¿½toï¿½i.e:ï¿½Tex
el,ï¿½Phoenix,ï¿½
>Jinnee, Artworx, Papillon and the rest of the long list...ï¿½ï¿½ï¿½

This is a joke, right...
Thing is on jinnee level, it may miss some cuteness and MAC HFS support
(i know u like that a lot) but its WAY of :it cant even came close"
category.Texel is good i admit, its contender is LDW2000, powefrull app,
but tbh, outdated and wont work on newer machines, Phoneix is not bad
either, ArtWork cant really see as long as DaLayout, DaVector.. note they
arent CUTER, but they are BETTER. And Papillon trigered me off, its shity
painter, or gfx processing app. ApexMedia is way better so its ESC paint,
Pixart is better if u want more compatible app, Photoline is better
processing application.... U may like those, im okay with that, dont make
them beter as they are, please and dont as always ditch all the others.

Janez

P.S those weren't only crashes, just 2 fatal ones.. It was during my testing
apps for Magic, so system was clean, no odd ACCs etc..

Well, I'm not saying that there are a ton of users out there, but if you base your estimate of the number of *platform* users on the number of *CT60* users, wouldn't you be way off? CT60 is Falcon only, and even saying that there are only 150 Falcon users would be inaccurate, as I know there are a number of Falcon users out there who haven't bought a CT60 for one reason or another. So I would guess the number of platform users (for me, this includes users of *all* models of 16 and 32 bit Atari machines, Atari emulation via MagicMac/PC or Aranym, and Hades/Milan clone users) would be quite a bit higher. It's of course impossible at this point to say, though, exactly how many there are, as many don't use this Newsgroup or other communication sources, or at least make their usage of it known very often. But 150 seems excessively low.

That said, I'm probably pretty safe in assuming the only people left are the extreme die-hard users, rather than the casual computer user who wouldn't really find the switch to PC/Mac a difficult one. But for those of us left, I think we're probably committed enough to use anything new and exciting that comes down the line, write programs for the platform, and care about its development.

While understanding that this would not give you a proper count, I'm curious whether anyone is running something equivalent to xplanet & xplanet markers to keep track of "active" Atari users?

Here is an example of how it is used, note the screenshot links at the bottom of the page.

http://wiki.sourcemage.org/index.php?page=XplanetMarkers

It can look like a mess with a lot of names, but you can adjust the output, and zoom in as close as you like.

Terry

In my opinion SpeedoGDOS is inferior to NVDI4 overall. That isn't to say that there aren't a couple of things SpeedoGDOS does better, but if you have NVDI4, you likely will never miss SpeedoGDOS.

I started in the world of fonts with SpeedoGDOS (and used Warp 9 for acceleration). When I purchased NVDI4 (from someone leaving Atari) I set my machine up to provide the option to boot either SpeedoGDOS or NVDI4. Over the years I found there was never really any reason not to use NVDI4, so I deleted SpeedoGDOS from my hard drive a couple of years back.

For what it's worth, if your printer works, there really isn't much reason to get NVDI5. I'm using 5.03 on my CT60ed Falcon, but reverted to 4.x on my stock Falcon due to strange behavior in PageStream.

I think your estimate is off by a good multiple. There are (IIRC)
about 150 CT60s sold or to be sold. There are also a fair number of
unaccelerated Falcons, TTs, and others that are still being used as
people's primary computers.

Add to this the number of STs that are used as secondary computers.
My mother, for example, used to use an ST almost every day to type
letters and play solitare games. Then her sister gave her a P90
running W95. Now my mother uses the P90 to type letters and play
solitare games when she is in the spare bedroom and uses the ST to
type letters and play solitare games when she is in her
workroom/sewing room. (Curiously, she has no other use for a computer
despite my attempts.)

While I don't doubt that our numbers are tiny (and don't change the
points you make), I'd suspect that there are probably 500 ST-class and
500 above ST-class Ataris in use worldwide on a regular (non-gaming)
basis.

Galen (who types this on a WinXP machine and longs to go home to his
Falcons)

>Since you have it...go with NVDI!

I agree. Note, however, that Atari Works can only handle (I think)
a total of 255 fonts - if you have more than that in your BTFONTS
(and/or TTF) folders, only the first 255 will be available.

AFAIK, this is a restriction of AW and *not* NVDI/SpeedoGDOS. It's
one reason why I switched to Papyrus and now Tempus-Word NG, which
don't have that restriction (I have 317 Speedo fonts in BTFONTS
plus another often-used 19 TTFs in a TEMPFONT folder that are
normally in use - the TTF folder with another 2400-odd fonts is
normaly not used directly, as I copy any TTF fonts required to the
TEMPFONT folder).

And no - I don't use all of them, or remember what they all are -
but luckily Papyrus provides a preview in its font selector, and I
also have the German Hugo font selector that offers a preview in
other programs.

Not a nice way to speak of your first girlfriend;-)

Innovation comes at a prices, so early on AmigaOS was a little unstable. Not
that that made early TOS (a hack of an OS) any more stable...

I don't know if NVDI4 included "Font Tools", but NVDI5 does and it makes enabling/disabling fonts a breeze - this is something that Speedo does not do IIRC.

I have a sheet of paper with instructions and the necessary parts attached to perform the Cubase Audio Falcon mods which I never got round to fitting.

The first person to email me with their postal address can have it; I'm afraid this is UK-only as I'm providing the stamp!

Please note that the parts are SMD so you will need the appropriate level of skill to fit.

I'll be checking the successful applicant (ie the first post recieved) against my kill file first, if you've been a time-waster in the past you won't get it.

> people's primary computers.

Well, I think the best source could be Invers. In their "Die Feder"
newsletter Ulf Dunkel from Invers said that in 2001 there was about 2200
active Calamus users, of which about 15% were still TOS users. This
gives us about 330 users actively using Calamus. And they mainly would
be TT, Hades and Medusa users and perhaps some Falcon too. You can
safely add to this number some users, that have SL 2000 and older
versions of Calamus and are still happy with them. I think most of these
people are proffesionals and they would be a potential buyers of Pegasos
with MiNT. So if we estimate about 300 professionals - Calamus users and
300 enthusiasts, we could probably count on 500-600 people who would
probably buy PowerPC platform running MiNT + GEM.
What's more development of native MacOSX version of Calamus is now in
progress. MacOSX is Unix based and works on Apple's PowerPC computers,
so Invers could quite easy port Calamus to Unix based MiNT PowerPC
machine like Pegasos and have profit of it! It makes sense for me.
Now if we could only find a few brave developers and make an agreement
with Genesi (producer of Pegasos) to add third OS to their boards. Adter
all they could sell more mainboards too and it shuld be profitable for
them - they don't need to change anything - just allow to make new OS
and give full documentation to Atari developers.

Me too :-)

> I also think basing an argument on a fixed number of users at 150 is very
> funny. CT60 sales is not a defining factor who may or may not do something.
Well, there are still CT2 and Afterburner040 users, who are just happy
with these accelerators and simply don't need or want CT60. But many of
them would gladly jump to modern board, that would be compatible with
their existing programs and would promise better and faster ones.

> If you have no falcon you would not be wanting a ct60, also it's no good for

That would be great. Many users of TT, Milan and Hades use still their
machnies professionally - mainly for Calamus, and if they could jump to
modern and fast machine not changing their habbits and software, that
would surely push them to go and buy PowerPC board with TOS compatible
OS.

Hi all! It's been a LONG time since i've been here. I just bought a big box with an Amiga 500 with loads of floppies, books, joysticks, mouse, power supply for a mere 5 euro! Remember the Big Enemy from the 80s? (:-)) Alas, no video cable. Surfing around i discovered that going from the 23 pin RGB Sub D Amiga port to SVGA is not that easy. I still have an old Atari SC1435 RGB monitor in the attic (Atari museum) with a 9 pin connection. Is this standard sub D pinout like on the Amiga monitors? Where can i find a diagram?
Thanks in advance, Atari forever,

Freek.

Mainly for Calamus? :)))) This makes me smile. Sorry, but Invers is not
planning TOS future IIRC and moreover Calamus would probably never be
adapted to a new OS with different CPU.

330 users of TOS Calamus doesn't say anything about users that would
spend the money for a new low support (all clone producers died, did you
notice it?) expensive buggy machine.

regards

STan

I won't fix as I am not developer :-)

> Mainly for Calamus? :)))) This makes me smile. Sorry, but Invers is not
> planning TOS future IIRC and moreover Calamus would probably never be
> adapted to a new OS with different CPU.
Maybe Invers won't release future versions of Calamus for TOS platform,
but that's because there is no suitable hardware to run this version -
professional users chenge their TOS machines to Macs or PCs. However as
I said there is Calamus version in development for MacOSX. This OS is
Unix based as MiNT is and of course it runs on PowerPC, so I guess it
would be relatively easy for experience Invers developers to port it to
Pegasos + MiNT PPC platform...

> 330 users of TOS Calamus doesn't say anything about users that would
> spend the money for a new low support (all clone producers died, did you
> notice it?) expensive buggy machine.
All clone producers died, but Genesi - Pegasos producer didn't and it
has been in businees for a few years. We don't need new hardware - it is
ready and not expensive - as I mentioned complete G3/600 Pegasos based
computer would cost about 600$ - that's not much - anyway much cheaper
than any of the TOS clones were and almost 2x times cheaper than
Coldfire board (supposed to cost about 1000$ for mainboard only).

A year ago I was able to talk to Ulf Dunkel of Invers. From what I've understand the next big release will not run on Atari even with Magic because Calamus will make use of a great deal of the native OS be it Mac OS or Windows. However, due the huge amount of work to make a native Calamus-version, Calamus will always make use of some kind of TOS-emulator. There are certainly no plans whatsoever to make a Linux version of Calamus.

>
> What would it take to turn a PPC machine (Pegasos or Power Mac) or a
> peecee into an Atari?

Nothing, it cant be done, if it wasn't made by Atari then nothing can make
it an Atari?

There's nowt 'new' for the 16 bitters, there's some old stuff to be found
that will certainly speed it up a bit thought.

Sam,

I'm very sarcastically picking on you. Just drumming up some
conversation. This group sees some good action thanks to your questions
drumming up activity. Don't mistake my complaining for innocent humor :)
By all means, ask the questions. It makes us feel important and perhaps
smarter than we really are ;-)

As for the question, you definitely want to use NVDI versus SpeedoGDOS.
Consider NVDI an upgrade of SpeedoGDOS.

Thanks,
Mark

:) Of course, but it is an extimate. It is up to you to choose whether
you agree or not. I'm not forcing anything I'm just showing my point of
view on the whole thing.

Still it seems that I can't leave the platform (some psychological
deviation that appears by former Atarians ;)). I just chose that I would
do only projects that would possibly give me some more education that
those I've been doing so far. So... stay tunned ;)))

Hey, if it can be done.....why not. My interest is definitely stoked!!

I love my Falcon, but it's not 100% Atari....it's the C-Lab variety. My knock against the Falcon is if I want to upgrade it, I'm gonna have to shell out a ALOT of bucks. I'm talking re-casing it to start, so then I"ll be able to add a hardware accelerator so that I can also modify the memory from obsolete simms to uptodate dimms, and so I can upgrade the video. Then, I'll be able to use off the shelf INTERNAL drives.

So, if you add all that stuff together, it'll run oh....$500-$600 dollars if not more. And then, you've got to be able to do some soldering and some metal cutting and trimming in order to customize the case. One screw and your Falcon mainboard is toast!
So, if this Pegasos board can be had for about $400 give or take, and run mint and all my Atari applications and such, yeah, I'd get one.

Yes it can - here are sample prices in Europe:
http://www.pegasos-de.de/
350 Euro for Pegasos II G3/600 is about 400USD :-)
Even this weaker CPU should be about 15x faster than 68060 found in CT60
:-)

Sam,

I highly advise installing a separate drive for the MiNT install if you have the know-how to do it. It gives you a bit of an escape route if things go sour ;-).

BTW: On a non-accelerated falcon, while I found MiNT to be useful, I also found it to be rather slow. If you want, I could probably find a 2.5" drive and create a nice MiNT setup for you and mail it.

Thanks,
Mark

That would be tremendously great except that my internal drive is a scsi. For some reason I guess C-Lab didn't like ide drives.

I think I've downloaded all the files I need, including the latest MyAes binary.

If I screw up I'll just start all over!! :)

Besides, I'm waiting to see if anything will be done with that Pegsos machine.

I browsed their website and I am impressed!!!!

I also saw where it's able to run several flavors of Linux, 2 Amiga OS's, a few BSD versions, Mac OS9 and OS X, Windows, and Morphos!!!!!

Seeing all that makes me believe that it can also run our favorite Atari software and OS's as well!

This probably should be the most exciting news in the Atari world!!!

Sam,

Don't use MyAES yet. It's just not ready quite yet for daily use.
Experiment sure, but don't try to use it. Use XaAES for now, grab the
latest beta off the unofficial xaaes development page (google for it). As
far as the clab drives are concerned, the story as I hear it is that the
internal 2.5" ide drives normal falcons had sucked, and were slow and
tended to fry under the weight of D2D audio recording. The SCSI drives
were a bit better and higher throughput.

This in mind however, I have a C-Lab Mk2 myself and I simply disconnected
my failed 2.5" scsi drive that came stock, and hooked up a 2.5" ide drive
to the existing fully functional IDE port.
If you need one of the mini-IDE cables, I got one, ide laptop drives
available in stores for fairly low prices, compared to what you get
storage wise. Take care to backup your data often, I don't trust these
2.5" drives much at all, at least the conners or whatever comes with the
c-lab machines. I also have for you, if you need one a convertor to use
a 3.5" IDE drive on that mini-IDE port, however this would probably
involve recasing your falcon since a normal sized IDE drive probably
won't fit.

Thanks,
Mark

It seems that the discs come formatted UDF as standard. Maybe HDDriver can read this, or maybe you can reformat them with FAT. They look like a hybrid hardware between HD and CD drive. If you want one of these for things other than your Atari platforms, then youve nothing to lose if it doesnt work...

Coda.

2801. New EtherNEC drivers

Newsgroup: comp.sys.atari.st
Date: 2004-04-23 20:26:58 UTC
From: Kenneth Medin <kennethm@tripnet.se>
Message-ID: <40898a1632c3b30@tripnet.se>
Source record: 19190

I happend to surf in at:

http://home.arcor.de/thomas.redelberger/prj/atari/etherne

and found new driver versions for EtherNEC!

Has anyone with a TT tried the new drivers with success?

EtherNEC and TT is a temperamental combination as is well known... I made some serious attempts but the best I got from the new driver was outbound ARP questions. These packets looks fine without errors but it seems the TT does not receive anything at all It does read the MAC, though. Tested with crossover cable to a Linux pc running Ethereal and Magic 6 on the TT.

The old driver works fine now but does seem extremely sensitive on my TT. After some initial tweaking I got ENEC.STX running perfectly for over a year. 6 months ago it started to behave strange if I rebooted the TT after it got warm. Turned out it could not read the MAC address right when warm! Mostly usable anyway with all sorts of strange MAC...

Things got worse and after Christmas I could not get any MAC at all and had to revert to nullmodem subnet to my other TT (with Genius LAN adaptor in the cartridge port). But, in January I suddenly discovered that ENEC3.STX suddenly worked perfectly! No hardware or software (tried with old backup) changes in meantime so something is aging in my TT that has influence on cartridge port timing...

So now EtherNEC runs perfect (warm or cold) here with the old ENEC3.STX (set to run in TT RAM and last in STING foler), but none of the new drivers do. It's a pity Thomas Redelberger does not have a TT to test on...

Bonjour :)

Download on my homepage or directly at:
http://rajah.atari.org/files/ -> meg12d_uk.zip (230Kb)

News or bugfixes:
- added 'Reply-To' and 'Bcc' for the search
- new friend type: own email address (in case the username
of the mailbox is different from the email)
- scan is desactivated while the mail client is running
- new POP3 receive routine (quicker, maybe less freezing)
- bugfix of the iso8859->atari conversion routine
- bugfix of size(s) of mail(s) announced
- more memory for analysis
(Thanks Kenneth ;))

For those who does not know 'Meg'. It's a mailbox verificator
and spamkiller (STinG/StiK2/Gluestik).

Learn to create music using Apple's new composition software. No previous music knowledge necessary. Learn everything from beats and grooves to theory and orchestration. Amp and Mic modelers covered too. One on one lessons. Feel free to drop us a line regarding anything to do with music and computers.

Logic, Finale, Digital Performer, Reason.

2804. TeraDesk 3.30

Newsgroup: comp.sys.atari.st
Date: 2004-04-23 23:17:12 UTC
From: vdjole@EUnet.yu
Message-ID: <c6c85k$2vu$1@news.eunet.yu>
Source record: 19193

Version 3.30 (please, 3.30 is not the same as 3.03) of TeraDesk open-source desktop is available at:

http://solair.eunet.yu/~vdjole/teradesk.htm

TeraDesk is currently the only open-souce desktop available for 16-bit and 32-bit Atari computers. Developers' goal has been to maintain TeraDesk as a small, simple, fast and reliable desktop, which would be functional in the modern multitasking environments and all flavours and versions of TOS-compatible operating systems, and yet to keep, as much as reasonable, familiarity with the original TOS desktop.

TeraDesk is NOT intended to be a direct replacement for the excellent but resources-demanding desktops like Thing or Jinnee, but instead is designed to be used where disk space or system memory and speed limitations (or price) make the use of those fine desktops impractical (e.g. TeraDesk's size and memory usage is currently only about 1/3 to 1/2 of Jinnee's in a similar setup).

Main improvements relative to the last published version:

- AV-server functionality; almost all AV-protocol messages supported.
- FONT-protocol functionality; TeraDesk can be a system-wide font selector.
- Drag & Drop protocol repaired (TeraDesk acts as a sender only).
- Repaired handling of ARGV protocol in Mint and Magic.
- Local per-installed-application environment variables can be defined.
- Symbolic links can be created, edited, deleted, copied...
- More logical interpretation of symbolic links when "opening" items.
- Filenames containing blanks are quoted when passed as parameters.
- Window-related menu items moved under a new menu title "Window".
- "Duplicate" window menu function added.
- Capability added to flag installed applications for special uses such as viewer, editor, shutdown, resolution change, file search, etc.
- Restore-mode copying enabled by [RShift] (overwrite newer files only).
- Update-mode copying enabled by [LShift] (overwrite older files only).
- Better handling of iconified windows, visible mostly in XaAES.
- When dialogs are in window mode, there is a closer widget which acts the same as Cancel button.
- Removed "normal" dialog mode as obsolete. Only the "flying" and "windowed" dialog modes remain.
- Removed startup batch file capability as obsolete.
- Improved memory allocation system used (new version of AHCM), for better handling of large blocks.
- Extensive cleanup of the source code.
- A number of bugs fixed.

Reports on any bugs found would be welcome.

Have fun.

> This probably should be the most exciting news in the Atari world!!!

I am a Pegasos II owner since January, 2004 and wanted to mention that I paid 300 Euros for the mainboard and not 350 as mentionned in some previous posts for a G3/600MHz.

It is still listed at this price on their page :
https://www.pegasosppc.com/store.php

I am basically a Linux user on this machine and I am very satisfied with it. There is yes the possibility to run OSes like Mac OS9 or OS X over Linux, and my try with Mac OS X was impressively fast despite my 600MHz only cpu. Well, I do not really use it since I stick to Linux but be aware of the fact that Apple forbids my law the use of Mac OS on non-Apple hardware. (There might me some exceptions but the Pegasos is not)

Finally, I also gave a try to Aranym, and 68000 "emulation" is quite deceiving in terms of speed, even my stock Falcon is faster so I gave up Aranym.

F.

Do you or anyone know(s) by chance if Calamus is 100% written in C code
or if it also has some 68000 assembly code inside. I am asking this to
get an idea if Invers could have the temptation to make a port to Linux
if all TOS system fonctions were natively provided by a linux based TOS.

Fred.

AFAIK MagiC is an operating system, *not* an application, but I doubt very much
that you're talking about a recent version. BTW you're the third guy now who
tries to pull MagiC into this discussion.... I somehow get the feeling that you
are all bored and want to see an OS War breaking out again? Sorry, it's to soon,
following a long standing tradition here, OS Wars are reserved for july-august.
But stay tuned to this station :-)

>>today__nothing_has_appeared_yet_that_comes_even_close_to_i.e:_Texel,
>_Phoenix,_ Jinnee, Artworx, Papillon and the rest of the long list..___
>
>This is a joke, right...
>Thing is on jinnee level, it may miss some cuteness and MAC HFS support
>(i know u like that a lot) but its WAY of :it cant even came close"
>category.

No, it's not a joke...
Featurewise Thing has a lot of catching up to do, but what IMO sets Jinnee
really apart are its plugins, in combination with Scripter it's unbeatable, not
only on this platform but on any platform. I have never seen/used a desktop with
the same functionality. Compared to it the Win XP and OSX desktops are kidstuff,
and I'm not even going to mention the Linux desktops at all. But then desktops
have always been excellent on Atari; Neodesk, Ease, Thing, Magixdesk etc were
all ahead of their time. Jinnee keeps the tradition going...

>ArtWork cant really see as long as DaLayout, DaVector.. note they
>arent CUTER, but they are BETTER.

I'm not talking about cute at all. DaLayout is a DTP package (that's how it was
marketed) so you should compare it to Calamus and the likes. DaVector doesn't
has a chance in my book, it has problems running on some hardware and in

addition doesn't work in all resolutions offered by graphic cards. And furthermore the outdated printer drivers prevent using it these days.
Import/export in DaVector isn't much too shout about either. Artworx can import/export all popular formats on this platform and in addition also Adobe Illustrator, EPS, WMA etc... and yep I know that WMA format is crap, but there happen to be zillions of pics floating about in that format, do you know another app on this platform that can handle that format? Printing is more than versatile, show me one graphic app which offers more choice to the user.
And it's also a Scripter and OLGA client, every serious Texel user will tell you the advantage of using Artworx for designing the graphs and being able to see the result directly displayed in Texel, try *that* with DaVector, and last but not least Artworx is available in English with a very good English manual... and no, for once DDP Translations has nothing to do with it.

>And Papillon trigered me off, its shity painter, or gfx processing app.

Shitty or not, but it's about the only thing with which you can construct, load and view animated GIF's, which runs on *all* Atari's. You always overlook that there's more out there then just Falcons. Someone who wants i.e to design a website on this platform, has no other option then to use Papillon. Oh and this reminds me, Artworx can use load/save PNG format also... and there are a couple of Scripter scripts which call up Artworx from Papillon or vice versa, throw in the OLGA protocol and you probbaly see the picture...so, design a bitmap in Papillon, call up Artworx and save it in PNG format.... or load a PNG file in Artworx, call up Papillon and edit it there thanks to OLGA.
That's about as far as shitty goes...

>ApexMedia is way better so its ESC paint,

Oh I believe you, but they both are Falcon only apps...
It might have escaped your attention, but there are people here using other hardware. You can say a lot against ASH, but they always made sure that the software they distributed was for *all* Atari hardware & clones, and most if not all of it runs in TOS and MiNT

>Pixart is better if u want more compatible app,

Compatible to what? And with what is Papillon not compatible?

>Photoline is better processing application.... U may like those, im okay with
>that, dont make them beter as they are,

I'm a Photoline user myself from day one. But it's showing it's age... no drag & drop, no AV protocol, no long file names with spaces... buggy printer routine, etc, but most importantly it's not a graphic design app, photoline is like you said a processing app, so comparing these two to each other is not really fair.

I'm not making them better, in fact I think they *all* desperately need a couple of upgrades, but then the competion is not really much too shout about either as I've just tried to show here.

But keep the faith Janez, at least you care, and that is a hell of a lot more then what can be said of some other posters here, you may like it or not but we

do have something in common <FAT GRIN>

Cheers from Belgium
Dennis

Sorry I don't know that.
However it seems I've make a little mistake in my previous message.
In Calamus Newstickers (05.05.2003) one can read that in the past Invers
didn't care about Linux because there was no good TOS-emulator available
for that platform. Also one can read that the port of Calamus is
proceeding step by step but they don't know when Calamus will run
complet natively under Windows, Mac OS X or Linux.

<quote>
Immer wieder mal werden wir gefragt, ob und wann Calamus unter Linux
verfi¿½gbar ist. Fri¿½her haben wir uns nicht um Linux geki¿½mmert, weil es dort
keinen sinnvollen TOS-Emulator gab und eine Portierung nicht infrage kam.
Die Portierung von Calamus li¿½uft mittlerweile in kleinen Schritten
schleichend an, doch ob und wann Calamus komplett nativ unter Windows,
MacOS X und Linux verfi¿½gbar ist, ki¿½nnen wir noch nicht sagen.
</quote>

In the same newsletter they point to a Spanish Linux user who is trying to
make Calamus SL 2003 running under Linux with the use of Wine. I did try
to run Calamus SL 2003 with Wine following the advise of that Spanish guy
but alas I didn't succeed. See <URL:http://www.yelos.come/wine/>

From: Sylwek <sylwekpWYKASUJTO@pf.pl>
Date: Thu, 22 Apr 2004 11:15:28 +0200

Hi Sylwek,

>Well, I think the best source could be Invers. In their "Die Feder"
>newsletter Ulf Dunkel from Invers said that in 2001 there was about 2200
>active Calamus users, of which about 15% were still TOS users. This
>gives us about 330 users actively using Calamus. And they mainly would
>be TT, Hades and Medusa users and perhaps some Falcon too.

Those figures are from 2001, I think it's safe to assume that at least 50%
of those 330 users have moved on in the mean time.

>I think most of these
>people are proffesionals and they would be a potential buyers of Pegasos
>with MiNT. So if we estimate about 300 professionals - Calamus users and
>300 enthusiasts, we could probably count on 500-600 people who would
>probably buy PowerPC platform running MiNT + GEM.

Between 1995 and 1999 when there were at least 200.000 users left, only a
mere 1500 of them bought a Hades or Milan. Let me put it differently: we
had our chance and blew it...
When the Milan was released it costed EUR 750, and about everyone agreed
that it delivered "power for the price", It took Milan nearly three years
to shift a measly 1000 computers... and in the end they died a very sad
dead. Just imagine for a moment that instead of 1000 computers they would
have been able to sell 20.000 -the available user base was large enough -
then right now they would still be in business, probably producing yours
and some others dream machine, and with such a relatively large userbase
software support would look different also. I can even see a 3th party
developer releasing PPC upgrade cards for the 68040 & 60860 machines.

Today, and I'm trying to be very realistic here, 150 people buying that
proposed machine would be a small miracle... Hades and Milan users bought
their computer when there was still relatively a lot of support for Atari
apps, today however things are quite different, and some of us (including
me) had visions of software being developed for those clones that addressed
the features of those machines. Today we all know better, except for a
handfull apps, nothing is developed nor upgraded anymore, open source
doesn't work either because there are not enough people who can actively
maintain/port it. So what it comes down to is that you want us to invest
(waste ?) money in a machine that offers only more speed... I can just as
well invest it in a G5 or P5. With those machines I'll at least know that
new printers, scanners, DVD writers etc will be usable... because so far
whenever someone here mentions the word "drivers" and who the hell is

going to take care of these, all we get from you guys is a lot of silence.

>What's more development of native MacOSX version of Calamus is now in
>progress. MacOSX is Unix based and works on Apple's PowerPC computers,
>so Invers could quite easy port Calamus to Unix based MiNT PowerPC
>machine like Pegasos and have profit of it! It makes sense for me.

It doesn't make much sense to me...
It's programmed in Cocoa, that language has nothing to do with Unix at all
porting it will be very difficult...
Following your logic every OSX app should be easy to port... to use Steve
Jobs his favourite line: "think again, think different" :-)
And what makes even less sense is that according to you Calamus should be
ported to run on a Unix based MiNT PowerPC.... I assume this is a typo? Why
on earth would an Atari program running under an Atari OS need to be ported,
as far as compatibility goes, anything we like to throw at it should run, if
it doesn't then it doesn't deserve the name Atari, TOS, MiNT, MagiC clone or
whatever, it would only be a very poor substitute.... any emulator performs
better.

>Many users of TT, Milan and Hades use still their
>machnies professionally - mainly for Calamus, and if they could jump to
>modern and fast machine not changing their habbits and software, that
>would surely push them to go and buy PowerPC board with TOS compatible
>OS.

Forget it...
These users have in the mean time already bought a Mac and run Calamus
under MagiCMac, Invers has not only adviced it but literally pushed them
in that direction for many years.
The "not so very professional users" bought a PC and run it under a PC
emulator. These professional users are not even remotely interested in
what you are proposing, their only interest is to run Calamus in a fast
and stable environment, and right now, that's possible on both the Mac
and PC. Professional users don't give a damn about this platform, their
only concern is that the work gets done with their favourite tool.
MagiCMac was the first incentive for people to jump ship, later when the
Pentium chips became more powerfull their example was followed by people
using PC-emulators. And the softwarehouses supported it... they still do,
just drop a mail to ROM or Invers and be surprised, nine times out of ten
they'll advice you to migrate to a MAC/PC.

Oh, and last but not least...
There's also a category of users who are purists, these people only want
to work with hardware labeled Atari, and there are more of these about
then you think. Even if you turn the earth upside down, they won't move an
inch towards your PPC based platform.

Cheers from Belgium
Dennis

Hi Mark,

>The problem IMHO is that a lot of things which should be system level and
>never should have to have been sold aren't. Extendos, HD-driver, NVDI,
>and various other system tools probably in all likelihood should be free,
>they should have been bought by Atari and included with TOS as part of
>MultiTOS.

Ah, well, like usual we have different views:
The problem is that Atari died in 1995 and it's not like they didn't supply
those tools, MetaDOS, AHDI, GDOS, SpeedoGDOS back in those days worked for
most users quite satisfying.

>More or less, this is all shit that should have been bundled with the
>computer to begin with. If it was, maybe people would actually be able to
>stomach the concept of purchasing all the other apps like Texel or a word
>processor etc. But how when they spent so much money just building a base
>system with appropriate licenses.

But is was bundled with the computer or with the additional hardware! stuff
like NVDI and HD-Driver are improvements, and if Atari would still be around
today I'm convinced that there would be no need for these at all.

>The power without the price thing might have led people who generally don't
>have money or don't want to spend money to our platform ;-)

If you ask me the power without the price slogan was only true for the ST, the
TT and the Falcon weren't any cheaper then the competition. For most ST users
upgrading to these computers was no option. I bought my TT in 1992 and payed
almost $4000 for it, and it seems to me that most people here forgot the price
tag that was attached to a Falcon also...

Cheers from Belgium

Hi Sylwester,

>Well, actually for me Signum! word processor was the weakest of the ASH
>applications. Yes, it was feature packed, but still quite far from Papyrus,
>not to mention that it uses its own GUI, not based on GEM :-)

I agree, Signum! 4.0 is indeed the weakest one of the bunch, but to be fair
let's not forget that development stopped in 1995, so you should compare
Papyrus 4.0 to Signum 4.0. IIRC Signum 3.0 was also the first word processor on
this platform that allowed us to use our colour printer... today, however it's
hopelessly outdated. I've just realised that this app has never been translated
either, it's probably not very well known by most people here.

>Otherwise we can of course argue whether MiNT is better than Magic

No, we will not.
MagiC is an OS, and this thread is about apps.

>I have just tried to install MiNT using EasyMiNT installer, but despite my
>long computer experience and reading supplied docs carefully it didn't work -
>it started with few dialog-windows, but unfortunately not even single
>character appeared in them - there were no such a stupid problems with Magic

The MagiC installation is foolproof of course, but like with most installers
you don't have any control of what is installed where and in what. This is not
so bad when you are new to the OS, but I can imagine that an experienced user
would like to have some more control...
As for MiNT, setting it up manually is not very difficult, anyone with a litle
basic experience on this platform should be able to if you ask me, but tuning
it to perfection however is a different matter, that's IMO mainly because the
docs are not very good.

But I have some good news...
In a couple of months you'll be able to download an installer which will really
make it a piece of cake to install MiNT/N.AES/MiNTNET etc. At the moment it's
not certain yet which installer will be used; GEMSetup or the ASH installer,
they both have their advantages and disadvantages. But rest assured, it's on
the way... people complaining about MiNT being difficult to setup will be a
thing of the past soon. As an avid MagiC user I vote for the ASH installer,
talking about irony at its very best.... <grin>

Oh, and while I'm announcing good news.... here's some more:
Last weekend the Troll newsreader archive was updated with an English interface,
the programmer asked me to announce it, but it slipped my mind... the docs are

not translated yet, but they're in the pipeline....

Cheers from Belgium
Dennis

>There is no clear and simple way to compute world wide how
>many Atari users there are and what would motivate them. Also as you noted
>who might come back if a REAL native OS reappeared with some real speed.

Oh Boy!!!
Do you REALLY expect anyone to come back? If the thought of it wasn't so ridiculous I would actually believe that you mean it! The only people that might come back are these with a mental illness. Anyone with a sound brain will stay away from this platform as far as he can.

Sometimes I really think you guys live in coockoo land... :-/

OK, let's follow that weird reasoning: assuming that for example tomorrow someone drops a nice dual G5 2Ghz TOS clone on us, so what? Why would that attract anyone new or even back again? It seems to me that the very first question which will be asked is software related... and what have we got to show? There's still no browser that can handle something as common as java applets, remember the mailer and newsreader discussion? The general concencus was that we needed something better, and until then a lot of posters would stick to posting from a different platform. Our entire software base is simply ridiculous today, there's absolutely nothing that will attract someone back and certainly nothing that will attract new users. And if that's still not convincing enough here's something else to chew on, if anyone sees what "productivity" software we have on offer he'll think we're a bunch of morons and run as far away as he can from this platform. We don't have a Powerpoint look alike, in fact we have no presentation software on this platform! And I just have been doing my utter best to think of an *English* database which isn't at least 10 years old and completely outdated, but I'm afraid that I've found nothing in that department either... spreadsheets, there's only Texel, which comes with a lot of bugs.... and little features compared to what's on offer FREE on other platforms. And we can't even brag about a word processor, Papyrus is too much bug ridden for that, and since no one here seems to like the new contender TempusWord NG very much...
So what's left? music, games, graphics: let's face it, it's all ridiculous by today standards, it's good enough for us, but certainly not to attract someone back. Someone who left this platform disgusted 5 years ago, won't see any improvement at all, he'll see that even less software is supported, released, updated & upgraded. Now, that's really the incentive to get someone back!!

Ok, back to reality... I admit that I was a bit over the top, but was I really so far off? Instead of dreaming of new hardware, we should really concentrate on getting some more advanced software first. We got two excellent OS's, all that's needed now is some software showing what they're *really* capable off.

Just look at what has been written for the Mac 68040's ten years ago, if it ran OK on that slow OS, then something similar should fly under MiNT or MagiC, surely there must be some stuff from the mac 68040 architecture that is now open and free? Is it really al that difficult to port it over? I can't imagine that it's more difficult then porting unix code, which is bound to run way to slow on our platform...

Please please please, wake up!!!! It's really five to twelve....

Cheers from Belgium
Dennis

>Not to mention the cost is not to bad, considering the Hades set me back 3 times
>that amount. And that was just the board, ram, and video card alone. ;-)

That's not really a fair comparisation. The Hades was the "Rolls Royce", and all the stuff packed in it was simply expensive in those days, prices of components have fallen dramatically over the years. A fair comparisation would be that PPC board with a Radeon 9800 card, 2 GB RAM and a G5 processor ofcourse....

This board in a way is just like the Coldfire project, they want us to pay money for already outdated hardware... think a couple of years ahead, it'll be just as antique as our hardware is now. A new clone should reflect the state of art in technology, unlike Mac and PC users we can't exchange it for something more advanced in a couple of years from now. USB-2, Firewire 800, Serial-ATA, PCI-X and all the other goodies are essential. I assume that someone bying such a machine wants to be able to scan, print, burn DVD's etc also? Well, then the above mentioned interfaces are essential.
So here's the 10 million dollar question.... who's gonna write the drivers?

Oh and for what it's worth I agree fully with Standa, whatever clone appears its bound to be a very low support machine, but then there's nothing new under the sun, we've been enjoying low support for the last 10 years and we're still alive and kicking (more or less)

Cheers from Belgium

> again? Sorry, it's to soon, following a long standing tradition here, OS
> Wars are reserved for july-august. But stay tuned to this station :-)

Na, u pulled Magic into it.. My idea is not to start OS flame, im stating u are biased. Any OS can crash, MiNT does that as well... My statement was that i got Magic, had probs (indeed they were 4.01 and 5.xx) thus ASH did offer not 100% safe programs to the public.. ASH (or it was magic team, i dont know) came out bad, since after is send a mail after probs with 4.01, their reply was:"Yes we are aware of that problem some time yet" and that was all, and 5.xx did same again...

>
>>>today__nothing_has_appeared_yet_that_comes_even_close_to_i.e:_Texel,
>>_Phoenix,_ Jinnee, Artworx, Papillon and the rest of the long list..___

And this is what i think its, well, wrong... There are apps as good, or better, but some not as friendly, or dont know modern protocols. Dilema is still what is better> painter which allows u to make better pictures, or painter which is more friendly.. Id choose 1st option, and thats why i think most of those apps have atleast VERY decent oponents.

>>This is a joke, right...
>>Thing is on jinnee level, it may miss some cuteness and MAC HFS support

> No, it's not a joke...
> Featurewise Thing has a lot of catching up to do, but what IMO sets Jinnee
> really apart are its plugins, in combination with Scripter it's
> unbeatable, not only on this platform but on any platform.

U see, now we talk different language... I wont claim Thing is better as Jinne, i claim its in same range... Jinnee is more "mature", Scripter is great as well, Thing has other advantages, like Thing Groups, better behaving in MiNT and unix FS... That don't make it better... it make it very decent jinnee's alternative.

> I'm not talking about cute at all. DaLayout is a DTP package (that's how

> result directly displayed in Texel, try *that* with DaVector, and last
> but not least Artworx is available in English with a very good English
> manual... and no, for once DDP Translations has nothing to do with it.

I hear u here.. DTP or not, i meant to say DaLayout and DaVector
especially, offers more as Artworx in its manin area: vector drawing. Esp
animation stuff is great etc.. Also basic drawing is more powerfull. Indeed
they may have some troubles with non standard gfx modes... Converting can
be done externally, but yes, Artworx know more formats.. altough none of
the recent ones... Still that again dont make it better. It make it fair
app, but not ages or eons better. Because as vector drawing app, DaVector
is more powerfull and imho, thats best argument if we judge vector gfx
applications.

> Shitty or not, but it's about the only thing with which you can construct,
> load and view animated GIF's, which runs on *all* Atari's.

I liked other feature at that time, dithering block to destination
palette. Actually, dithering is a bad point of Papillon, but it was nice
option.. But that again, don't make it better... It slowness make it
impossible for hand drawing, etc.. I used it few times for some demo pics
etc for my scroller and im sorry, but its slowness and awkwardness really
get to my nerves...

> That's about as far as shitty goes...

Well honestly it is a shitty painter. It is fair app in whole, but i
would (and did ;) use others for most tasks..

>>Pixart is better if u want more compatible app,
>
> Compatible to what? And with what is Papillon not compatible?

As u stated, i mentioned Falcon bounded apps, Pixart is widely usable on
all Ataris so i added it to a list..

> I'm a Photoline user myself from day one. But it's showing it's age... no
> drag & drop, no AV protocol, no long file names with spaces... buggy
> printer routine, etc, but most importantly it's not a graphic design app,
> photoline is like you said a processing app, so comparing these two to
> each other is not really fair.

I think it is. Reason i mentioned Photoline is because Papillon is really
a bad painter, or as u said, gfx design app. Most stuff i did with it, were
processing nature. Drawing is really bad part of Papillon, thus for this

app i mean, it really has better alternatives..

> I'm not making them better, in fact I think they *all* desperately need a
> couple of upgrades, but then the competion is not really much too shout
> about either as I've just tried to show here.

Well u definately did not say it that way. Alternatives are quite strong, most sadly from older era, but back then they were brilliant... Absence of "less important" stuff, like av servers etc dont make them less good in their basic expertise... thats what i have to say.. Bottom point: beside ASH there are VERY good apps as well. Many better, ASH just stood the time and remains arround when most gave up etc.. I apreciate that, but i think many apps from other houses, were atleast as good...

Depends how u look.. Falcon was $1000, but it offered a lot. Take
CubaseAudio etc, price for PC/MAC, capable what Falcon could do, was
ridiculous. And both TT and Falcon were/are used looong, when PC ppl
updated hardware more times... At its time, Falcon offered much more as the
opposition for such money...

Neither enec.mif nor enec3.mif work on my TT (MagiC! 6.20,
MagiC-Net). I had to reinstall the previous enec3.stx :-(

Sam,

I live in Pennsylvania ;-).

Well if you plan to recase, I can just send you a 3.5" drive with the
proper adapters formatted with a nice MiNT install for an unaccelerated
falcon @ 14MB.... that probably won't cost much.. Maybe $5-$10 for
shipping, but I must warn you, I'm very busy with GIM development,
preparing for an alpha release so it'll be a week or so before I can get
to it.

BTW all, GIM is nearly ready for the first crappy but useable release ;-)

Coming from TT age (1989) was Mac IIci - it was 6700USD with slower
processor (68030/25MHz). So even at introductory price of 4000$ TT was much
better priced than comparable Macs.

Mark,

Someday we need to get together.....it would be nice to meet another U.S.
atarian face to face......it's been way too long since I've seen one!!!

It will be some time before I recase my Falcon. I'm saving up the bucks to get
an AB040 and nemesis video card/adapter.

That is from overseas. But go ahead and send the 3.5 drive....if I have to,
I'll just live the cover off the Falcon! :)

BTW, will GIM run in Mint? It sounds really interesting.

Thanks,

Source record: 19123

>against the Falcon is if I want to upgrade it, I'm gonna have to shell
>out a ALOT of bucks.

Well, that is exactly what I did. Fortunately I already had a case to put it in (removed my old MSTE out of its tower) but even though I had to buy the following things:

CT60 with CPU EUR 250
Fanless power supply EUR 220
Very quiet harddisk 80 GB EUR 80
DVD CR/RW combo drive EUR 70
14 MB RAM Card EUR 70
512 MB FastRAM EUR 80

EUR 770

Well, that is quite a lot of money but I got for it a fanless, noiseless MP3 jukebox (with Aniplayer) that is also capable of surfing the web (with CAB or Highwire).

I can also write CDs with my machine (5x with CD Writer from Anodyne) or read DVD ROMs with it (ExtenDOS Gold, HD-Driver), use it as an email/newsreader client (CAT), chat with ATARIICQ and write large documentation without crashes (with Papyrus X compared to MS Word).

I believe that the question: "Is your computer REALLY working, I can't hear anything?" from PC users was worth the money. :-)

Regards,

Frank

Don't know for Magic-net, but on MiNT u definately must use OZK's drivers,
superb stuff. U could give them a try with Magic-net.

2835. Using Meg to delete SPAM

Newsgroup: comp.sys.atari.st
Date: 2004-04-25 11:51:32 UTC
From: neil@adel6.freeserve.co.uk
Message-ID: <c6g8o4ttc1@news5.svr.pol.co.uk>
Source record: 19124

Hi All

Does any one know how to get information on setting up Meg 1.2c?

I have been getting a lot of SPAM email in my Freeserve mailbox and want to automate the process of getting rid of it! Currently I am using Newsie's excellent "Get Selected Mail" feature which still involves scrolling through the mail headers and deleting the suspicious ones. Every day I get 150 junk emails.

Luckily Freeserve have started marking the "Subject" line of the emails with "*** SPAM ***" before the rest of the subject line. This means that I could use a filter program like Meg to delete 95% of junk emails. Is this a correct assumption?

Can anyone tell me what to put in the Mailbox dialog, as at the moment when "check mail" is selected Meg runs but is "Waiting" and OK - but nothing else happens - this is after dialing in with STiK2.

The Email client I use is Newsie961 under STik2 and Magic 6.20.

Thanks

Neil :-)

I fitted a 3.5" 6.4 GB IBM IDE drive into my stock Falcon case
with no problems - it just lies on top of the shielding, wrapped
in card to insulate it and has worked fine for some years now. I
can't believe that the C-Lab Falcon case is any smaller than the
original.

Is this program only for Eclipse graphic card?
When I use this program on my Falcon with NOVA graphic card (800x600 65k color deep) then are false colors in the TGA file.

Sam,

Currently GIM Only runs in MiNT and Magxnet. STiK compatibility is
secondary though will likely be added and will be available as a
configuration option later on. As a current AIM client, gim is nothing
that wonderful, but the alpha version sets me up to really improve on it.
Once you have a working client that isn't that great, you really have a
lot more motivation to improve on it ;-)

> the emails with "*** SPAM ***" before the rest of the subject line.
> This means that I could use a filter program like Meg to delete
> 95% of junk emails. Is this a correct assumption?

If your mailserver put this "*** SPAM ***" string in your subject,
yes, you can delete them automaticaly with Meg.

You have to add a filter on the subjects which contain this string.

> Can anyone tell me what to put in the Mailbox dialog, as at
> the moment when "check mail" is selected Meg runs but is
> "Waiting" and OK - but nothing else happens - this is
> after dialing in with STiK2.

You have to declare at least one mailbox (you can add more of your
mailboxes). You should see in NEWSie preferences: same parameters.
In Meg:

Account= name of your mailbox (name it as you like)
Hostname= servername (ie mail.club-internet.fr)
Port= 110 (POP3 protocol)
Username= login to the server (usualy your internet login)
Password= password to the server (usualy your internet password)

Bonsoir :)

>> Reminder: this software is used to get screens (or screen parts)
>> snapshots (ST, TT, Falcon, Falcon + Eclipse/ATI RageIIc).

>Is this program only for Eclipse graphic card?

was coded for it (still problem in 8bit mode, but due to the driver),
but it's also working with normal Atari WITHOUT graphic card.

>When I use this program on my Falcon with NOVA graphic card (800x600 65k
>color deep) then are false colors in the TGA file.

The problem is that if your VDI driver use byteswapping (Motorola <>
Intel) or not, and if its vro_cpyfm function (VRAM to TT/STRAM) is
correctly written.

Bye

Pierre

Hello folks,

I wanted to pass along this screenshot which I'm quite proud of, since it means we have passed all major hurdles, buddy list is done and text entry is done as well as message receive buffers. All the data structures are done for their final implementation but all the vdi calls and UI design will surely change in the long run.

This has been *quite* a learning experience for me. I have to give HUGE credit to windom, which is an AMAZING gem library! As well the libfaim and Gaim project who cut down my work big time! Proof that open source CAN AND DOES help our native GEM applications :)

Name blotted for privacy.

>News or bugfixes:
>- added 'Reply-To' and 'Bcc' for the search

When searching for "Not for me" I guess? "Bcc" sounds strange and I
assume you really mean just "Cc".

>- new friend type: own email address (in case the username
>of the mailbox is different from the email)

I still have problems with some mails from Yahoo mailinglists if I turn
on a "Not for me" filter. I tried to add a "my own address" like "atari-
midi" but they got filtered out anyway. Maybe wildcards are not supported
in this function...

Actually I would like to have a possibility to filter on any header line
and to be able to locate mails with words like "Atari" or whatever in
the message text.

A function to read in addressbook files from Okami and Mymail on startup
would be excellent. Maybe too complicated but a simple textfile with one
email address/line should not be too difficult. It's very time consuming
to manually add all email contacts to the friends list. The fact you use
a modal and not movable (at least not in Magic) dialog makes it even
worse...

>- scan is desactivated while the mail client is running

Hm, Does not make sense?? Which mail client?
Previous MEG versions did freeze if a mail client was busy downloading
mail and did not allow MEG to log on right away. Maybe it retries to
login in this new version.

>- new POP3 receive routine (quicker, maybe less freezing)

Previous versions used to hang on certain posts (usually from Russia
for some reason). This new version instead makes a 30 seconds timeout and
then starts again so it's much better. I get a couple of houndred
spam/day so it used to hang all the time. Something is still wrong but I

don't mind waiting 30 seconds now and then as I don't pay by the minute.

I actually added to the program so the "STATUS:" line displays mail number in the mailbox that is scanned at the moment. When MEG frooze i could then manually delete the offending mail and rerun MEG after killing the tcp connection with TUR_GEM.APP (Olivier Booklage).

I made the same alterations to the latest version too, so I can see what is going on. It's a very simple global counter. Also it might work to have MEG react on GEM redraw messages once for each mail checked. It looks a little ugly as it works right now.

Also you might put in a EVNT_TIMER() call in the long scan loops. This would make MEG take less resources while polling, I think.

Finally MEG leaves the tcp port in "CLOSE_WAIT" state taking up one line in TUR_GEM.APP for each run. No good as MEG can be set to run once every 5 minutes or so. Will end up with lots of not properly closed sockets...

This behaviour was present in previous versions as well. Interestingly this only happens with my Tripnet mailbox (running Exim/Debian). A mailbox at my ADSL provider does not show this effect.

MEG is really a saviour as the amount of SPAM has reached silly levels here... Without MEG I would have to switch to another way of getting my emails...

Hi Janez,

>>and it seems to me that most people here forgot the price tag that was
>>attached to a Falcon also...
>
>Depends how u look.. Falcon was $1000, but it offered a lot. Take
>CubaseAudio etc, price for PC/MAC, capable what Falcon could do, was
>ridiculous.

I simply look at the price tag...
When is was released it costed 1250 EUR & USD, and at the time of release there was no Cubase Audio in sight. It wasn't until 1995 that some really good software started to appear, and by that time it was already too late. Shortly after is was released Atari announced that the STE production was ended, so they regarded the Falcon as the successor. The STE costed 300 EUR & USD back then, the price difference was simply too large for most users (gamers) to upgrade. Viewed from a commercial angle one can only conclude that the Falcon was a failure, and it was probably also the Falcon which was the final nail in the coffin. Personally I have known a lot of people back then who migrated to a different platform. I agree that technically speaking the Falcon was the most advanced one, but a lot of users weren't waiting for a computer with a DSP chip. A lot of people expected a 68040 based computer, three years after the TT. And the last thing they expected was a basically slower computer housed in a 10 years old ST casing.

>And both TT and Falcon were/are used looong, when PC ppl updated hardware
>more times... At its time, Falcon offered much more as the opposition for
>such money...

That's true, but then we had no idea of this back then. If someone in 1991 would have told me that 13 years later I would still be using the TT I would have ROTFL.

>At its time, Falcon offered much more as the opposition for such money...

Yes and no, on paper it wrapped up the competition, but in practical every day use it was a different story. It took quite some time before some apps appeared that exploited the power hidden in the Falcon. And for people who were more into DTP or office tools, it didn't offer anything extra at all. On the contrary, both the TT or MegaSTE were much more suited... Apps like Apex, Cubase, the SoundPool stuff etc have pulled it into a different class but these apps only attract a small portions of users.
Like with any computer or games console there should have been a flood of

games released in 1993 for the Falcon, but it didn't happen, probably
because the softwarehouses thought that not a lot of people would invest
$1250 in a computer to play just games on it. Don't forget the competition
of the STE, A500 and A1200, the handfull of games that were released in 1993
were not really an incentive to upgrade to the Falcon either. Like I wrote
earlier it was only from 1995 onwards that some really amazing software was
produced, but two yera is an awfully long time in computerland....
In 1995 the competition was already working on PPC and Pentium 90's :-(

Cheers from Belgium
Dennis

>> Proof that open source CAN AND DOES help our native GEM applications :)
>
>Only an idiot would think otherwise. :o)

Yep...
That's one, so that leaves another zillion to go.
BTW: it doesn't proof much, all it shows is that it can help a programmer at a certain stage in programming by using & incorporating some of the existing code. Do I have to understand from this that no one on this platform would be capable of programming a messenger without help of open source routines? Then we are really in bad shape!

So what's next on the list? A peer to peer server perhaps?

Cheers from Belgium
Dennis

Hi Sylwek,

>I am looking for the last Photoline demo (it was 2.25 as I suppose) that
>was ever released.

The last version was 2.30, there are two versions one for use with an FPU
and one for use on machines without these or emulators. They have been both
translated in English. Also check out the DDP website for a small patch app
that fixes some issues and adds a little more functionality. The patch is an
official one from ComputerInsel BTW.

>I want to purchase Photoline32 for MacOSX and I was promised by producer,
>that I will get free serial number for Atari version then

If you can boot into OS 9, use it in that manner, you'll notice that it'll
run at least 25% faster, and that's quite a lot... Photoline32 10.xx is a
carbonised OS 9 app.

>Has anybody it and could send it to me via mail?

No problem, just let me know what version you need.

Cheers from Belgium

From: Sylwester Pietrzyk <sylwek_usunto@a4.pl>
Date: Sun, 25 Apr 2004 00:28:03 +0200

Hi Sylwester,

>Coming from TT age (1989) was Mac IIci - it was 6700USD with slower
>processor (68030/25MHz). So even at introductory price of 4000$ TT was much
>better priced than comparable Macs.

Back in 1989 there was no TT for sale yet, Atari presented them in that year
but it was only early in 1991 when they finally arrived at the dealers. I
bought mine in february 1991. I think I was one of the first TT owners in
the Benelux countries. And it wasn't a very good deal. The TT came equipped
with a buggy TOS 3.01 and a 720Kb diskdrive. I had to fork out an additional
$250 for a *good* TOS and high density diskdrive later that year. Until I
had TOS 3.05 fitted, working with it was hell, except for a lot of bombs
there wasn't much to enjoy.In january 1992 they replaced TOS 3.05 for 3.06
free of charge.
I wasn't comparing the price to a Mac, I only wanted to say that $4000 for
most of us was not feasible, and the best proof of this was Atari releasing
a cut down version of the TT a year later (the MegaSTE).
I dug up the original invoice, and that $4000 was much too low:

TT030 2MB => 2800 EUR & USD
2MB ST-RAM => 250 EUR & USD
4MB TT-RAM => 400 EUR & USD
105Mb HD => 450 EUR & USD
TT VGA monitor => 450 EUR & USD

So it was more like $4600.

Also, the Mac might have been more expensive but the users didn't have to
invest in an additinal graphic card anymore (which also costed a small
fortune BTW), and the Macs could be expanded with relatively cheap 30pin
SIMMs. In 1991 the direct contender was the IIsi which costed $5000, and
only 6 months later Apple released the Quadra 700 and 900 based on 68040,
Atari did nothing for 2 whole years until they replied with the Falcon
which compared to the Quadras was a joke. And then people wonder how Atari
never succeeded in wrapping up the professional market!

Cheers from Belgium
Dennis

I already have and do not need this, but I suggest if there is
anyone out there who wants to hook their ST to a SVGA Color
monitor to buy this. All you have to do is to be a video converter
and hook the Video Key to it and you will be able to use the SVGA
monitor in color with your ST. I just may get his if no one
bites...

Hm, TOS 3.01 is really not that bad... I have one of those to the right
here and it mostly run Cubase Score in monochrome. I have also used it a
lot with plain TOS or Gemeva/Neodesk and later Magic in VGA. Never had
serious trouble with it.

I hardly feel any difference to the TOS 3.6 I'm writing this on. On the
other hand I never had any problems with TOS 1.2 either...

Ermm, Well with the oscar protocol. No. libfaim is pretty much the only
implementation, of which it's likely that Trillian and the others copied
from. Now aicq also uses some sort of oscar library written by Dan
Ackerman. Where he got the info, who knows ;-)

also note that a good reason for Atari's failure was NO marketing dept.
(my opinion). To this day, if you mention Atari you hear back, "oh yeah,
pong, space invaders, 2600". No one out of the music loop even knew Atari
made computers! And if I'm not mistaken, Atari built the first 64 bit game
(Jaguar) when Genesis and Nintendo was 32 bit. The unknown Jaguar was left
stranded on Walmart's shelves! If there were any ads, I sure didn't see
any.

2872. GEM Instant Messenger Dilemma

Newsgroup: comp.sys.atari.st
Date: 2004-04-28 02:34:36 UTC
From: Mark D <mducksub@nossspamXXatari-source.com>
Message-ID: <pan.2004.04.28.02.34.35.618908@nossspamXXatari-source.com>
Source record: 19061

Hello folks,

I have a question for you, the potential future users of GEM Instant Messenger. The path I can choose now is fairly simple. I choose to either use the last standalone libfaim package, dated November of 2002 or I can use the latest libfaim incarnation which is now a part of gaim. The problem is, using the one that's built into gaim is going to take a LOT of work. To put it simple, I've been working on it all day and haven't gotten even 1/4 of the work done to the point where I should even THINK about compiling, let alone be finished debugging and understand it.

The other libfaim implementation is done but it doesn't support server side buddy lists. So I have to ask the question, what matters more. Having server side buddy lists and the latest features, or having a working product asap?

Thanks,
Mark

2 arguments in the other direction though, If I have never sent a file
over aim in my life, nor had the need for direct connect, why should I
bother implementing it? ;) The cardinal reason for writing open source
apps is to solve my own needs, which as long as the old code actually
WORKS, it will solve my needs.

The second argument is that the latest versions of jabberd's aim transport
is actually using an OLDER version of libfaim. Food for though, it's
really complicated.

Thanks,
Mark

I must have blinked and missed one! From what I hear (which someone more knowledgeable than I can add to or correct), If I see a network ad by Dell it's paid for by Dell but the Trimiels wanted the dealers to pay for the ads. That didn't happen and Atari equipment gathered dust on the dealers shelves hence, lawsuits against Atari corp.

Mark,

It's your program dude! You design it the you think it shoud be.

All I care about personally is simply being able to IM people the way I do now on my XP box using AIM.

If that is how you're designing it.....great!!!

> > Ackerman. Where he got the info, who knows ;-)

Actually AOL released a draft OSCAR spec to the public, which led
to M$ adding it to MSN and the ensuing fight. It is by no means complete
or current, but does give at least a glimpse at what the intention is behind
the data of the incoming packet. Once you have some sort of model to
throw the data against, figuring out what it means is alot easier.

>
> Part of it might be based on technique known as reverse engineering.
> Logging incoming messages and examining the data stream. Been forced to
do
> this myself actually.
>

Yes alot of logging data and disecting it. That and trading with other
programmers
and sharing information on lists etc.

The great problem with the IM stuff is that it's not homogenous. The lack
of a
definitive RFC has led to a myriad of variations.
You can have GAIM doing one thing with packets while Miranda does something
slightly differently. Then you have competing protocol info sites, where
they both
have slightly different information about what a packet contains and what it
means,
and of course the bold claims that they are correct and that the other is
wrong.

In the end dumping packets that don't work and disecting them has been the
best

solution for me.

Hello Joe.
At present I am using the latest version of Linux Debian
Woody. If you could get hold of a copy of Potato version, you will have
less of a worry to install. The limitation are from graphics via X with
Gnome and KDE. This is due to processing speed. It is worth a try if you
want to use alternative OS. It very good for learning Unix controlling.
You still can use the graphics via X with desktop called OLVWM, FVWM
FVWM95 ICEWM and Afterstep. If you need extra assistance I would be glad
to help and there lots of helpful newsgroups. There is no harm in giving
Linux or even Mint a try.

> Does it worth a try?

I've seen it on a TT (which is considerably faster than a Falcon) and it was very stable but pretty slow. Especially when you want to use X. :)

If you just want Unix functionality, MiNT should be nice (it's even TOS-compatible). :) Again, X is extremely slow, but MiNT is nice for combining Unix text-based apps with Atari GEM software.

If you really want a Unix without TOS-compatibility (of course, TOS-compatibility puts limitations on the Unixeness), BSD might also be a good choice. It's lots faster than Linux because it is better optimized for the Atari. Apparantly, even X runs at a usable speed although I've never seen it run myself, so I don't know.

If it's really Linux itself you want, an old second-hand PC (586) can run it faster and cheaper. Since Linux (and BSD) leaves nothing of the Atari's "personality" in tact, there's not really any reason I could think of for running it on an Atari, except perhaps because it's possible, and fun to show your friends. :) (I must admit using Linux on a TT felt pretty cool). :)

Maurits.

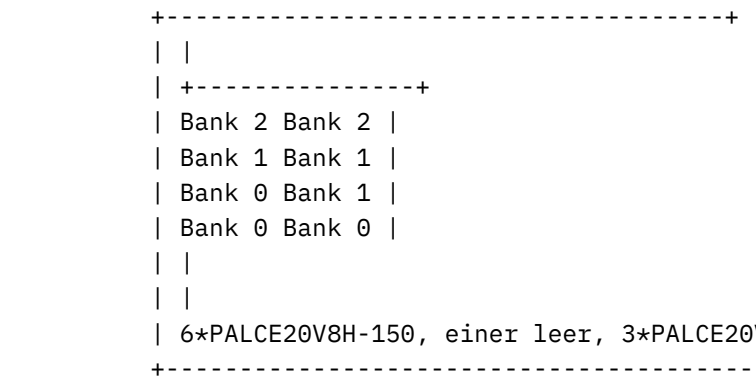
>And can also somebody tell what kind of simms to use to get 32 Mb.
>Samsung or Toshiba Siemens....

Here is some relevant info from "Chips 'n Chips" by Michael Ruge:

Jumperbelegung Bankbestï¿½ckung
J0 J1 J2 Bank 0 Bank 1 Bank 2 Bank 3
2-3 2-3 2-3 4 MB 4 MB 4 MB 4 MB
1-2 2-3 16 MB 4 MB 4 MB 4 MB
2-3 1-2 16 MB 16 MB 4 MB 4 MB
1-2 1-2 16 MB 16 MB 16 MB 16 MB



Die Migthy-Mic 32 wird mit Page-Mode Ram-Modulen in SIMM 30Pin
Bauform mit einer Zugriffszeit von 60 bis 80ns bestï¿½ckt. Fï¿½r eine
16MB Bank benï¿½tigen Sie 4St. 4M* 8(9) und fï¿½r eine 64MB Bank 4St.
4M* 8(9). Eine Einwandfreie Funktion gewï¿½hrte GE SOFT damals nur
mit SIMM Modulen der Hersteller Samsung oder Toshiba.

Have you tried DoitST? If not, you can find it here:
http://www.doitarchive.de/downloae.htm

> And can also somebody tell what kind of simms to use to get 32 Mb.
> Samsung or Toshiba Siemens....

I think manufacturer doesn't matter in this case - it is more important to use right kind and speed of SIMMs - EDO or FPM - 60, 70 or 80ns? I think you will find the answers in DoitST. Just remember to send them e-mail to get a key to ZIP file.

Funny how the first person to jump to this conclusion is likely someone
who never coded anything in his life. It's called a LIBRARY. Just like
libc is a LIBRARY, a library. Because everyone who uses gemlib or windom
to write their program is stealing code too right?

Why should his filter be tweaked? An tenth of a seconds thought would
show that he was responding to quoted text within Mark's message.

> So you couldn't program one either without stealing someone else's ready
> made work?

That's what libraries are for, and why they are made available. Think of
any project that you do during the course of the day. Driving to work;
Cooking Dinner; Watching television, pretty much anything. When you do them,
are you not "stealing" someone else's ready made work? Everyone with an
ounce of sense recognizes this - Ever heard the regular comment from the
scientific community about someone being able to see farther because they
stood on the shoulder of giants? About not reinventing the wheel?

Hi Lonny!

Yes! I was also impressed at the first glance. And moreover I am impressed more and more not only by the WinDom itself, but by its authors. Big thanks to them both!

I was so impressed that I went patching that library for my needs. We are talking about the changes that would make it ever cooler than it is right now - And it is not that I would like to say that it is not cool enough ATM for sure!

I strongly suggest all remaining GEM application developers to give this library a try.

And... moving from GFA is not that a big deal, believe me, once you try to work with WinDom in C then you would never change back :)

best regards

STan

Thank you all for the replies.
Currently I'm using MiNT. The only thing I would like to try Linux is that I have to buy many softwares If I want it to use MiNT(HDDriver, NAes, Thing, NVDI, CDDriver, etc... ,just to mention the basic things. I already payed for many of them). I ordered a CT60, so I don't have much money left for my Atari.
I've heard that Linux for Atari is source compatible with other linuxes, so the programs will cost almost 0. I think the CT60 will be powerfull enough to run Linux. (In the future I also planning to buy the SuperVidel from Nature if it finally finished)

That is exactly the case and tweaking filters would require filtering out
everyone that replies to such nonsense. The above comment which I initially
dropped is a perfect example. It's utterly stupid and obviously intended to
provoke. Apparently not everyone has figured out that is their main hobby.

2899. Re: [ANN] Meg 1.2D (bugfixes)

Newsgroup: comp.sys.atari.st
Date: 2004-04-29 11:07:56 UTC
From: Pierre TONTHAT <ptonthat@NO.club-internet.fr.SPAM>
Message-ID: <c6qnkh$70c$1@news-reader5.wanadoo.fr>
Source record: 19087

Salut Kenneth :)

> When searching for "Not for me" I guess? "Bcc" sounds strange and I
> assume you really mean just "Cc".

Oups... i did not understand your last mail... i'll remove this "Bcc"
search.

> I still have problems with some mails from Yahoo mailinglists if I turn
> on a "Not for me" filter. I tried to add a "my own address" like "atari-
> midi" but they got filtered out anyway. Maybe wildcards are not supported
> in this function...

I'll verify the "Not for me" with "my own adress"...
There are not wildcards "?" or "*" in Meg, just a string search (with or
without case sensitivity).

> Actually I would like to have a possibility to filter on any header line
> _and_ to be able to locate mails with words like "Atari" or whatever in
> the message text.

Well, good suggestion, added in the wishlist for the next upgrade, but
please wait.

> A function to read in addressbook files from Okami and Mymail on startup
> would be excellent. Maybe too complicated but a simple textfile with one
> email address/line should not be too difficult. It's very time consuming
> to manually add all email contacts to the friends list. The fact you use
> a modal and not movable (at least not in Magic) dialog makes it even
> worse...

Can't make the dialog windowed, so "import" is added in the wishlist.
Can you send me an exemple for Okami / Mymail address book ?
This is not urgent, i'll can only upgrade Meg in late June, after a new
Troll release.

> >- scan is desactivated while the mail client is running
>
> Hm, Does not make sense?? Which mail client?

This does make sense: my mail client is aMail and i noticed Meg could scan
while i was browsing the "remote" mailbox in aMail.

> [new pop3 receive routine]
> Previous versions used to hang on certain posts (usually from Russia
> for some reason).

Okay, good to hear. I think these servers are badly administrated or are down from time to time.

> I actually added to the program so the "STATUS:" line displays mail

Can you send me your modifications ? (with a comment or "! <-------" string so that i can note them). I'll integrate them in the next bugfix.

> [redraw between each mail scan + evnt_timer()]

Okay, added for the next bugfix.

> Finally MEG leaves the tcp port in "CLOSE_WAIT" state taking up one line
> in TUR_GEM.APP for each run. No good as MEG can be set to run once every
> 5 minutes or so. Will end up with lots of not properly closed sockets...
>
> This behaviour was present in previous versions as well. Interestingly
> this only happens with my Tripnet mailbox (running Exim/Debian). A
> mailbox at my ADSL provider does not show this effect.

it depends with the remote mailserver: the logout is implicit. i'll inquire on it for the next bugfix. Maybe an explicit tcp_wait with CLOSE param is needed but this function is not very well implemented (I used it for Troll beta1, but it was running only for STinG and freezed under STiK or Gluestik).

> MEG is really a saviour as the amount of SPAM has reached silly levels
> here... Without MEG I would have to switch to another way of getting my
> emails...

Hope Meg helps.
I never launch my Falcon at home, without running Meg. All the spam is purged and Meg is very efficient now, with correct and choosen filters.

Tips : (in first position, this will be quicker)
- delete mails with HTML only
- delete mails which from contains ".kr>"

Regards

Pierre

I suggest you either elaborate this, or keep quiet.
Who has stolen what? And what do you refer to with "ready made work"?

I can only refer to myself here, but can not see a problem with using
existing code that is either supplied by original author, or freely
available on the internet. Either by using snippets from it, or by
learning from it. Without such stuff I would certainly not have a clue
about how to code GFA at all. Now I have a clue at least ;)

It is obviously a comment by person who don't understand coding: reverse engineering is to observe certain application's logs and outputs compared to input with a goal to understand the protocol and principle used in that XXX server, application, whatever.. It is simply necessary if we want to do some client for some protocol, let say some peer to peer, if docs and specs are not public and code is not GPL or available.. U don't use one byte of code of observed application or protocol, so hardly stealing of other code.

No matter what application u examine, N.AES or Magic or Texel or Airc... it use some parts of code by other coders, if nothing else, atleast drag n drop protocols, commandline protocols, av_start etc etc, so this thread is only meant to insult coders.. by non coders.

"GFA" works fine on my AMD 2600+ Athlon too, using GNU/Linux. This is
just a, "hey, neat" kind of comment. See:
http://x11-basic.sourceforge.net/

Myself, I almost never program in C or C++ .... I do all my compiled work
(the the package management system and other utilities in the distro I develop
for is, interestingly enough, programmed in bash) Modula-2 or Oberon-2.

Just to make sure, he also posts what seems like the entire contents of his catalogues on this group whenever he changes them, which annoys pretty much everyone else by cluttering the place up.

Haven't really tried it "ARANYM" itself (meaning, running from within another environment), but I do use the Live CD version of it on an older machine here (a Celeron 400), and I think it's quite nice. For you purists, what can I say.... All of my Atari hardware is in storage back in Maine while I'm stuck in Nevada.

Yeah, I saw your post a while back on c.s.a.advocacy, but didn't have anything useful to add. Since you ask specifically though, it always boots to fullscreen for me. This is on an old gateway with a 15" monitor though.

Sometime I might try to compile that for mint. I have looked at that page
before and it's neat that he went for gfa compatibility.

> Myself, I almost never program in C or C++ .... I do all my compiled work

I used modula2 briefly for about 3 months while helping my cousin make some
pixel routines for his peecee some years back. It was quite easy to learn.

Reverse engineering != stealing code and in many cases requires much more intelligence and knowledge than writing the software ever did to begin with, besides I don't remember Lonny admitting that he himself did it, but that it was a way that certain things have been written - namely Gaim's Oscar protocol, DeCSS, and many others.

The true intelligence level of certain people around here is coming out swiftly.

Aranym is brilliant.

I dont have to worry about the life expectancy of my
13 year old TT.

I keep up to date Aranym installation on a PIII laptop
and a Athlon desktop.

In the config file somewhere you can select OpenGL to be used. That
allows smooth scaling to take place on resolutions that are not the
same as the nearest on the host screen...

Is reverse engineering stealing code? How do you steal code that you
derived yourself without someone else's illegally-gotten source code?
What part of any patentent, original program's code does Lonny
possess? Seems to me, by reverse engineering, he means he came up with
his own code by simply examining protocols freely and openly used
online, by free programs, that are freely available on PC/Mac/Linux. I
don't see how that's stealing.

Stealing is taking something directly owned by someone other than
yourself. If he had taken illegally-obtained source code and derived a
program from it, that would definitely be stealing. Looking at
information (i.e. protocol data) being legally sent to you and
deriving code from scratch in order to view that information can't be
stealing IMO, unless someone specifically holds the rights to that
information. Has Lonny done that?

Just some food for thought...

2928. [UTD] May Release of Eureka

Newsgroup: comp.sys.atari.st
Date: 2004-04-30 06:08:37 UTC
From: Francois LE COAT <lecoat@atari.org>
Message-ID: <c6sqcf$97s$1@news-reader1.wanadoo.fr>
Source record: 19023

Hi,

The software "Eureka" is updated and released on its WEB page.
It is a "2D Graph Describer and 3D Modeller". It is updated
nearly every month, if I found significant improvements for it.
You will have to fetch it at :

http://eureka.atari.org/eurka405.zip
That is the Complete Common Edition

http://eureka.atari.org/eurka020.zip
Is the Complete 68020 Edition

http://eureka.atari.org/eurkafpu.zip
Is the Limited FPU Edition

http://eureka.atari.org/eurklite.zip
Is the Lite Edition, working on early ST with 720kb floppy

http://eureka.atari.org/lib_dgem.zip
Are Dynamic Libraries Extensions for Eureka

http://eureka.atari.org/tiny045.zip
Is the OpenGL Extension (requires previous package)

A new AES has been published. This is MyAeS
(http://myaes.free.fr) that is very interesting for
users and developers. Eureka definitely takes advantage
of it. You should use it ...

I wish you big fun with all this new STuff !

Best regards,

-- Franï¿½ois LE COAT

hi

BIG SNIP

What I can say,,,,...some, many years ago, some went wrong, it all started with M$. To look on ex m$ win 2k it can open a webpage in every program, will we have that shit in our Ataris, not me. If I want to look at the web I open a webbrowser, not a filselector or a standard windows which normally shows icons. When I want to read e-mails I open ex. Mymail or Newsie or Okami, whatever mail client I use /etc..

The web and the mail, to send html based e-mails, the traffic increase a lot and the postboxes the ISPs got must grow to contain all mails, and don't got the "full quoted" mess. Some ppl, ex m$ like to do web to some eh.. publicservice TV thing, with heavy things, that make you to upgrade browser, OS, computer /etc..to what need, I can't get it. When do they put it in mails to. Newsie, was the first mail apps I used in my Atari. Can just C that thoose who want aka m$ things in Atari software are contaminated with m$ fever. But it's more for comersial stuff, instead a company send thier http link in a mail, they send they whole homepage, almost. And all win/linux common mail clients send mail defalut as html, you have to configure the client to send it as plain text.

I like the concept, Atari are great computers, and small programs. oh yeah I got a lot of computers, before anyone yell I say I mail this with Netscape Messenger 4.5, just coz I some months ago first did Magic 6.20 destroy my patitions, when a waterleak, so I'm in the stage to use MiNT for now, lost of backup/restore, that I could save.

Beware mail clients from reading html mails...

Regards

M.Lj aka MrAtari

More food for thought... any source code I might happen to come across has to be 100% hand translated into GFA. Again, totally recoded from scratch.

I am certainly not going to waste any time trying to find a posting
you are misinterpreting on purpose.

As has been mentioned by other ppl that also know more than you on
this topic, I need to state that reverse engineering is not the same
as stealing code. In order to get a communitcation app working
smoothly, it is often a necessity to see what other clients are
sending/receiving. Any lib for chat clients now available are most
certainly the result of such work.

/Joakim

From a technical point of view I should think that it would be very hard to get a smooth (sync) signal from the mains, everytime someone switched someting on in your street your TV would flicker, let along when the TV adverts come on, mains is not that clean (better now than then).

I also have a suspicion that all (old) B&W sets could run at both 50 and 60Hz, can anyone confirm this? Not sure why?

Hi Atarians!!!

The ST:

Can play from the soundchip 3 channel sound and 1 channel noice. Sound effects and "audio feedback", alarm and keyboard click.

Yup, get it right boy, it seems you ment an ST/F/M.

The STE, Enhanced:

The Stereosound chip in the STE represent digital (sampled) sounds. It works via DMA and do not eat power from the CPU. DMA chip get soundvalue to a D/A-converter. Sampling rate is 6258, 12517, 25033 or 50066Hz. The sound is filtered and then reach volume/tone-controlechip a National LMC1992m before they are accessibility via two RCA-sockets. The soundchip can either play stereosound, different sounddata in the sockets, or monosound, same sound in both sockets. The sound are also sended out to the TV's or monitors loudspeaker.

The soundchips active-signal (which is connected to timer A:s way in) goes from active to deactive when DMA-chipet has got the last word in the loop. There is however a mfour word large FIFO-buffer (First-In-First-Out) in the chip. This mean that four samples (eight in mono) will be played before the sound ends.

Also 3 channel sound plus 1 channel noice from the Yamaha syntheziser chip, plus audio feedback as alarm and keyboardclick.

Source: ATARI ST/STE HardFact of Magnus Zagerholm ISBN:91-86201-04-2.

Regards

MrAtari

> 4 channel sound is wrong if you mean "all dma". It is 3 channel YM + 1
> single DMA sampled voice. If you don't mind that 3 of the 4 voices are
> chip voices, than you have ofcourse 4 ;)

More like slip :-(

I guess that parcp would work though, but I don;t think the source is
available :-(

btw..

Anyone has got hdd_dmn to work ???
I have this program source code, and want to rewrite to work in win and
linux... but the protocol doc is in czech...
does anyone knows czech ?
or anyone get it to work ?

What's wrong with SLIP? I've been running Debian Woody on a TT here and installed most of the system through Debian apt on a SLIP connection to my other TT running STinG acting as a router to my Ethernet LAN. Works great and 115200 bps is not too bad. You need plenty of time anyway to run Linux on a 32 Mhz TT...

I upgraded it to Sarge (testing) some time ago and it took a couple of days to complete but it did work. Even installed Aranym via Dselect but as expected it did not run at all :-)

The cli is quite usable but X exits with a signal 11... Apache does work well but it feels too stupid even for me as Weblight is up and running on the Ethernetted TT...

With the right bootstrap commands it works well with an ET4000 Spektrum card in monochrome. In colour the pallette gets mixed up with light yellow text on white background... Not really suitable for reading...

Does not matter much if you look stupid as long as you don't get a live
webcam working with that Instant Messenger...

By reading this NG you get the feeling all Atari users are kind of
stupid... but that would include myself as well... Guess I have to think
this over again... On the other hand it's fun to do stupid things on the
Atari like trying to start Aranym on the TT... not to mention writing
stupid posts to the NG :-)

Well doing nothing at all is what he excels at. I've never see any projects
of his done in assembler or anything else for that matter. Actions speak
louder than words and this is rather boring anymore.

I'm in Canada.

2950. [ANN] Cresus beta 7 (bugfixes)

Newsgroup: comp.sys.atari.st
Date: 2004-05-01 09:40:08 UTC
From: ptonthatNO@SPAMclub-internet.fr
Message-ID: <40937077$0$307$7a628cd7@news.club-internet.fr>
Source record: 19044

Bonjour :)

Reminder: Cresus is an application to manage/survey your
banks accounts.

Download on my homepage or directly at
http://rajah.atari.org/files/ -> cresusb7_uk.zip (150Kb)

Bugfixes:
- crashes at launch if automatic operation (2 bugs:
deleting a job after its use, confirmation dialogue
for an transaction that is not a transfer)
- windows sliders managment: no more wild selection,
nor opening of editing windows
- transaction deleting via the "~" popup: say 'no'
correctly avoid deleting now
- the birthday is no more necessary
- ":" instead of "h" for hours in English date format
- flags correction for non private memory allocation
- translation fixes in the HYP and BUB, by http://ddp.atari.org

'Merci' to Olivier and Derryck

Sorry for this only-bugfixes version. I have no time to upgrade
it. Troll and DGEM will require my energy.

Regards

Rajah Lone / Renaissance
http://rajah.atari.org

>possible to create a stx for emulate Iconnect API ? I'm not coder but

At the moment you cannot use Emailer or Fiffi with STinG. Unfortunately it seems that there will never be a solution for this.

>the best software (Emailer, Fiffi) run only with Iconnect and Iconnect
>is bad...

Sorry, but I do not agree. There are better programs for Email and FTP and most of them are free.

I recommend aFTP for FTP and CAT for email/news but you can also give aMail, MyMail, Marihuana Mail or Newsie a try.

Regards,

Frank

Source record: 19045

Due to upgrading our home office we have the following communications
equipment for sale.

Siemens Single Line Gigaset Cordless 2.4 Ghz 4 Phone System (four handset
maximum)
(Doesn't have message recording)
One 4210 base unit
One 4200 extension (handset same as the base unit)
Two 4000 extensions
Power Supplies for each
Owner's Manual. (Also has Siemens 800 Help Line)

Outstanding voice and features.
Talk between units, even if one of the other units is making or receiving an
outside call.
Answer a call on any handset and transfer to any of the other handsets.
Call one or all the handsets.
Room monitor if wanted (i.e., the baby's room)
Backlighted display.
Caller ID
Hold 200 names with numbers in the directory.
Voice dialing.
Name each unit with it's own name, i.e., Dad's Ext, Sue's EXT etc.
Custom ringing or no ringing (nice if there are two phones in near
proximity).

Sold as a set $200.00 (save over $100 from store price)

Hi Cyril,

>the best software (Emailer, Fiffi) run only with Iconnect and Iconnect
>is bad...

Bad?
When connected at 46000, Iconnect will give you an average download speed of 6100. Except for the copy utility from Magxdesk it's the only app running and actually using MagiC threads, and it shows, it won't slow down with more then 15% when Emailer, Fiffi, Chatter and CAB are all running and doing there stuff together. Try that with STiNG...
Start up Iconfig and activate the PRO option, tweaking some of the default fixed values will make *all* the difference. I can't really give you any figures because these differ from ISP to ISP... so you'll have to apply some trial and error. Unlike with STiNG the user at least has the opportunity to tweak Iconnect to give optimal performance.

Another route to follow is MagiCNET, the iConnect API is quite good.

>Who can create it ?

According to one of the remaining top programmers here, it's best to open a book, read it, and do it yourself...

Cheers from Belgium
Dennis

>
>That is exactly the case and tweaking filters would require filtering out
>everyone that replies to such nonsense.

Yep, and that's a dilemma isn't it?
But you could for example filter yourself away, and that would help a lot, over the last six months you are on top, nobody replied to more of my nonsense then you.

>the above comment which I initially dropped is a perfect example. It's
>utterly stupid and obviously intended to provoke. Apparently not everyone has
>figured out that is their main hobby.

Did you say provoke? You've publicly announced that I'm in your kill filter, but whenever someone quotes a piece of text from me, you're the first one to react to it. You do not want to hear, read, hear anything of my "nonsense" hence the filter, but you can't resist posting whenever you see a piece of quoted text carrying my name. It's a free world, you can post as much as you like, but these posts are not constructive, informative, helpfull etc in any way, they don't even express an opinion. They're targetted towards me, and there only purpose is to degrade and make riduculous.... has it ever crossed your mind that this is PROVOCATIVE also? Do you really think you score points somewhere when referring to me as Pennis? You've been playing this stupid game for a year now, you really must hate my guts! And what good has it done? I'm still here...
People who know me a little, are stunned that I haven't reacted to your repeated provocative remarks. I've ignored your nonsense trying to keep the peace in here. But enough is enough... the choice is yours, you can show that you're an adult, or continue your personal vendetta in here. And if you choose to continue it, well be my guest.... you ain't see nothing yet. :-)

Could anyone please quote this? I want to be sure that Conny reads this.

Cheers from Belgium
Dennis

This is not the exact word for what he means. He does have problems with
IConnect (I have some too). My guess is that the fault is on his phone
line but the weird thing is that STinG gives no problems to him so far.
(I do not have much problems with STinG either)

Mark, thanks for coding "anything" for our platform. I've never used
any instant messanger, so I have no comment about it, but I do plan on
trying it sometime. Regarding the unfortunate direction of this
thread, remember that "It makes no sense to argue with a fool, because
onlookers can't tell which is which."

Hi there!

With all the activity going on with AES development these days (i.e. XaAES and MyAES), I was wondering, and thought it might make for some good discussion, what would you want to see in your "ideal" AES? (And perhaps some of these might actually be read by an AES developer and included?)

Mine is mostly cosmetic, rather than protocols, as I think we already have a good basis for that established. Here's my list...

1. Editable window frames (like Natframe on Magic), but allowing the user to define a transparent color (like a transparent GIF) that allows what's behind the window to show through. Then let the user define for themselves the dimensions of each window element. This would let you create more contoured windows rather than the dull, squared-off windows we're currently limited to. For example, one could conceivably make a window frame that has a wavy outter edge, or curved corners, or even a completely circular window frame, with a square section cut out of the center where the actual window data is displayed. You could even make window elements that seem to float away from the edge of the window by putting transparent pixels inbetween.

2. An *option* the user can associate with individual programs to display either standard AES 4.1 icons or Magic icons for that program. For instance, you can set most programs to follow the standard AES 4.1 definitions, but define the option for Papyrus to use Magic-compatible icon handling so that the icons in the program are in color instead of grey and black. This might be handled similarly to how Geneva handles program runtime options independently.

3. A single-tasking emulation mode option for programs that don't run under a multitasking environment. For instance, Cubase doesn't seem to work well (at least for me) under any environment but single-tasking TOS or Geneva. So any time I want to use it, I have to reconfigure my OS and reboot, or reboot using a boot manager. I'd like to just be able to run the program from within my multitasking environment, have the AES freeze other running programs and become single-tasking, just for that program, the way Geneva does, only under Mint or Magic OS.

Anyone else have ideas? I'd be interested in see what kind of things other people would like to see.

Since it was a reference to one of my posts, let me add that I have been told that exact same think by even more advanced programmer's.
That is a valid suggestion. Especially for this platform. ;-)

The correct place to fix this is in Papyrus, not in the AES. Bodging is a
sure way to bloat and instability.

> Anyone else have ideas? I'd be interested in see what kind of things
> other people would like to see.

A way to replace and add new object types to the AES without resorting to
userdefs. E.g. by loadable modules. This way it's possible to "skin" the
entire AES, not just the window frames. And you can add new functionality
in a much safer way than today.

Well it can be due to some internal protocols or login/ident differences..
there are variations,a nd it seems iconnect doesn't support this particular
one...

I have a SC1224 (Samsung) that has siezed up / frozen Brightness and Contrast knobs. But the volume is fine! Weird. This seems to be quite common on this samsung brand. Another one had all 3 frozen, and another user told me his does the same thing. What is the best way to loosen up the knobs? I don't want to force it and have them break, as the monitor seems to be working fine otherwise.

As long as the difference is understood. It's quite complicated and not
many people have time to waste not reusing code on an open source project
;-) I would be one of those people. But actually I think libfaim could
possibly be LGPL meaning I may not even have to release the source. But I
am.. I can face the embarassment and criticism ;)

Now *that* is why atari is where it is. Because it's reasonable for graphics card drivers to cost $100 right? Especially when other platforms give such things away for free. (That's just an example... I hear the amiga world is even worse in this respect) In a prior time sure, that might have worked, now anything software-wise really should be done for free. There's no money left to be made on this platform. And there's just not enough people left to re-implement quality software like Emailer, Fiffi, and all the likes. But the attempt is there.. Highwire is shaping up, Troll is quite nice, etc.

If you are that stupid you don't know. Well forget I mentioned it.
I picked up a book and read it, several actually and that's how I got
where I am software-wise. If you assume I went to school or took any
additional classes you assumed wrongly. The amount of ignorance you give
off is overwhelming anymore. Geesh.

Well, I agree with you ideologically. Unfortunately, in most cases I
don't think that'll ever happen. For example, I don't think CAB will
ever see another update, and its icons are designed for Magic. On any
other AES, CAB's icon masks just look ugly and strange. And I've dealt
with ROM on the Papyrus issue, and they won't budge. So, my opinion
is, why not let the user make the decision on which AES protocols to
use? I'm sure there are not so many differences between the Magic and
AES 4.1 GUI protocols that it'd make things *that* unstable and
bloated. Anyway, these are just my own personal "wish list items", and
aren't anything that absolutely must be done. Just ideas...

Sounds good!

I also thought of some other things to add, like non-blocking
drop-down menus, so that programs can continue running when they are
opened, and MacOS X- and Windows XP-like shadowing effects behind
anything displayed on screen (i.e. menus, windows, icons, etc.) for
machines fast enough to handle it.

Hrmm.. You don't. Though I suppose a utility could be made easily enough
to adjust the partition id. It's not rocket science or anything (but not
something you should know how to do). If you have an HDD editor you could
edit it yourself actually.

But alas when it comes to actual software that can do it for you, the only
thing I know of is HD-Driver.

Course when I send you an HDD this will all be done for you. But I sure
didn't think about the legalities of NVDI and all that. What licenses do
you have? I guess I could setup everything for you but you're going to
have to put your own nvdi.prg and such on the drive.

The ideal AES would make damn good use of Truecolor. Everything I've seen now is fairly pathetic, and the difference between 256 col and truecol is negligible. I want to be impressed ;-)

So what was I using for the past year or more on my Falcon?

This gateway, the STinG gateway plus Magxnet and a broadband connection
brought together STinG and IConnect clients, and I could even use Draconis
should I have desired. And much faster than the corresponding STinG setup as
Dennis has also testified to.

Did I mention that IConnect and Emailer can also be scripted?

Apologies to the OP as this doesn't answer his question, but there's a point
that has to be straightened out here!

Message-ID: <c72g8u$5vj$1$830fa79f@news.demon.co.uk>
Source record: 18970

I have for sale in original, fully working condition a classic HP Deskjet 550C printer. This is the four colour version, i.e. CMY & K and works with Atari ST (and others). I've had this years and recently gave it a good clean/overhaul. It's now in tip top condition, I've just fitted a couple of brand new original HP cartridges to it at a cost of £10 to test it and the print quality is superb for a 300dpi printer of it's age.

I'm also throwing in a brand new black and colour cartridge (both genuine HP unopened and recently cost me a further £10) with the printer.

Comes with a high quality parallel cable suitable for connection to the Atari and the original HP power supply (like a brick).

Genuine offers over £20 (UK only)

If collecting, I'll include a working (but no ink, and needs a clean) Deskjet 500C for spares.

Private sale, can accept Nochex, Debit Cards, Cash, Cheque, Postal Orders, Bank Deposit, etc.

Postage with parcel2go is £10.56 with £100 insurance included, or can deliver/meet within 50 miles of Prestwich, Manchester for cost of petrol (approx £10 per 100 mile return trip) or collection possible.

Source record: 18971

I have an Atari 1040STF which has stopped working and I've narrowed it down to the main board itself. All other parts available from it including keyboard with red led instead of green found on my STE, floppy, power supply, case (clean), and any other bits inside. I guess the case might be quite rare as it doesn't have the hole in the rear for TV being an STF not the STFM (F=floppy/M=modulator)

Anyone wanting to buy as spares or any of the bits please email offers, thanks.

Postage at cost with royal snail.

Well I had Linux up and running great on my Hades060 and even had XWindow, but after I upgraded my motherboard it would not run anymore. From the short experience I had with it, I would say it is something that Atari computer owners could use. Someday I will try it again after the installation software has been upgraded.

>get a smooth (sync) signal from the mains, everytime someone switched
>someting on in your street your TV would flicker, let along when the TV
>adverts come on, mains is not that clean (better now than then).

You misunderstand. The sync in the TV set was not derived from the mains, but the sync-pulse generator at the TV station was locked to the country-wide supply grid so that the sync-pulses were at the grid frequency. Actually the supply frequency is not really influenced locally by load changes. With heavy loads over a wide part of the country, the whole grid may be pulled down by a fraction of a hertz but that's all. Of course, this does not apply for some islands etc that are not connected to the grid and may set their own frequency.

>I also have a suspicion that all (old) B&W sets could run at both 50 and
>60Hz, can anyone confirm this? Not sure why?

No British TV sets, or German ones, that I saw would take 60Hz TV standards. Just a few speciliast monitors used in TV stations etc. were dual-standard. OTOH, the TV set itself would probably run from a 60Hz supply (though I have never seen such a supply outside N. America or parts of South America and Japan) - but with the risk of a 10 Hz rolling hum-bar. Modern colour sets in UK and Europe, at least, usually handle both 50 and 60 Hz TV standards. Quite possible that US sets don't, though.

Regards, /Peter/

Hey Mark,

I've got NVDI 4, Extendos Pro, Atariworks, and Pagestream. I am planning to order HDDriver this week...as soon as I can locate a North American source. Thanks,

Hi Lonny!

L>I-Conn_emu 1.00 16 KB I-Connect gateway for MagiCNet and
L>MiNTNet. Coming soon :-)
L>

For beta testers, this has been available for quite some time now. And it's working, at least to some extent. I don't have EMailer, but at least Cab with Iconnect-OVL did work for me, and even Chatter is able to go online, but crashes once I try to enter text.

With best regards
Ekkehard

>So what was I using for the past year or more on my Falcon?
>This gateway, the STinG gateway plus Magxnet and a broadband connection
>brought together STinG and IConnect clients

Do you know, whether this gateway also works on MiNT-Net?

But as I understood you need MagiCNet for this so you have IConnect clients
running on MagiCNet and STinG clients running on MagiCNet as well.

Well, this is a start but it's not IConnect clients with STinG. :-)

Regards,

Frank

2987. FS (US) CT60, Falcon Nova, DynaPort SCSI/Link-3

Newsgroup: comp.sys.atari.st
Date: 2004-05-03 06:01:50 UTC
From: silvercreek2k4@yahoo.com
Message-ID: <c4071fff.0405022201.672d8799@posting.google.com>
Source record: 18978

I have the following for sale:

1) A CT60 which has never been used. Still in its original bubble wrap with original cables, heat sync and fan. No longer required.

2) A Nova graphics card for the Falcon. This includes the original manual and driver disk, the board that plugs onto the internal Falcon extender bus, the ATI Mach64 graphics board and cables.

3) A DynaPORT SCSI/Link-3 with Firmware 2.0f. This has both the RJ-45 type connector and the coax. I also have the PSU for this.

All items are believed to be working and in good shape. The Dynaport is missing one of the four clips that go round the shell, but this doesnt affect the performance.

Will ship internationally, but note I'm based in the USA.

Offers / questions to

silvercreek2k4

at

yahoo.com

Cheers.

> corners, or even a completely circular window frame, with a square
> section cut out of the center where the actual window data is
> displayed. You could even make window elements that seem to float away
> from the edge of the window by putting transparent pixels inbetween.
MyAeS use already a bitmap 32 bit true color as a TGA load at start,
it can be modify by anyone. It use alpha channel but not exactly
transparency but for be able to modify color of widgets (for example
for first window plane etc..)
To have real true color, actualy it's impossible and probably
impossible for a long time! sorry.
>
> 2. An *option* the user can associate with individual programs to

It's a desktop problem not an AES problem, if I understand what you
said.

>
> 3. A single-tasking emulation mode option for programs that don't run

> the AES freeze other running programs and become single-tasking, just
> for that program, the way Geneva does, only under Mint or Magic OS.

MyAeS can be launch as a single AES even above Mint, I'm not sure it
solve most problems.

>
> Anyone else have ideas? I'd be interested in see what kind of things
> other people would like to see.
There is a lot of things to do, I have lot of idea really new, in
futur step and easy to do :-), but actually all my time is spend to
fix MyAeS due to bugs, and it's longer than I thought.

It's one years this month I have start MyAeS, it a long work!

2992. FS Jag System

Newsgroup: comp.sys.atari.st
Date: 2004-05-03 15:32:20 UTC
From: sf0218@aol.com
Message-ID: <20040503113220.21890.00000560@mb-m23.aol.com>
Source record: 18983

The system consists of:

Jag Console, Jag CD, 1 controller, all boxes and manuals.
The boxes the Console and CD came in are a bit roughed up each on one side, but are still usable.

CARTS
AVP, RAIDEN, RAYMAN, ZOOL2, VAL d'ISERE, KASUMI NINJA, THEME PARK, TREVOR MCFUR, FIGHT FOR LIFE, CYBERMORPH(no box, came with Jag).

CDs
MYST, BLUE LIGHTNING, GRID VID (note: last 2 came with JagCD).

BOOKS
Jaguar Official Gamers Guide.

I’m asking $130.00 for the entire system. Shipping is extra.

I’ll accept cash (if picking up), personal check, cashiers check, or Postal money order. On personal check, system ships when check clears.

Please to reply to my email.

Thanks,
Sam F.

Hallo Frank!

FS>Do you know, whether this gateway also works on MiNT-Net?

The gateway itself is working, but IIRC some clients need MagiC Threads and
therefore won't run under MiNT, regardless which stack is in use.

FS>Well, this is a start but it's not IConnect clients with STinG. :-)

For me, MagiCNet is working fine and is more stable than STinG was. And I don't
use Iconnect clients either, except for testing.

I agree! I used STiNG for quite a long time, and it was ok, but both
STiK 2, and eventually MagXNet gave me a *much* better, more solid
connection with fewer dropped packets (via dialup, anyway - don't have
broadband yet). And with MagXNet, I can use STiK/Sting, I-Connect,
Draconis, and *some* MintNet clients. That you can't do with STiNG,
and as I haven't seen any STiNG updates for years, I get the feeling
you never will. The only advantage I can see to using STiNG is that
you can use it in singletasking (if anyone still uses TOS for Internet
anymore), you don't have to mess with all the Unix config files (which
aren't really that difficult to figure out, and there are many who can
help you), and you can use the DaynaPort SCSI/Link drivers (only
available for STiNG at the moment - anyone willing to port them to
MintNet/MagXNet?). So if you have the time to learn a little about how
they work, I'd definitely look into either MagXNet or MintNet,
depending on the OS you run.

It's mostly not a problem of the AES that for example Cubase run only
under SingleTOS. The problem is that Cubase access the hardware directly
and thus is incompatible with MagiC or FreeMiNT as only one instance can
manage the hardware ressources.

I'd suggest getting in touch with ESNA. I had rather good service
from them a couple of years ago, and I think they stock HDDriver.

http://www.chez.com/europeshareware/english/products/atari/

Otherwise, the official English language source for HDDriver is Atari
Workshop. They will charge about $60US IIRC including shipping.

http://www.atari-workshop.co.uk

Frankly, ordering from Europe isn't that difficult so long as you have
a Visa card. The shipping is a bit higher than one might like, but
it's coming a long way!

2999. TAT Announces back copies now available!

Newsgroup: comp.sys.atari.st
Date: 2004-05-03 20:44:21 UTC
From: "Gregory D. George" <greg@ataritimes.com>
Message-ID: <Faylc.553320$Po1.447915@twister.tampabay.rr.com>
Source record: 19013
Cross-posted to: rec.games.video.atari,rec.games.video.classic,comp.sys.atari.8bit,comp.sys.atari.st

THE ATARI TIMES ANNOUNCES: BACK COPIES NOW AVAILABLE

April 26, 2004

For immediate release:

WINTER HAVEN, FL - The editor of The Atari Times (www.ataritimes.com) has announced the availability of the 2001 Year End Issue and the 2004 Compendium at CafePress.com.

Both books include 100 or more pages full of news, features, reviews, and previews for all Atari home systems that have appeared on the website. These include articles for the Jaguar, Lynx, 7800, 5200, 2600, home computers, and even the arcade systems. Each book is in black and white with a wire-o binding and an excellent color cover.

Gregory D. George, editor and writer for The Atari Times commented, "The moment I ran out of the original run of these books, people were asking for reprints. Well, your demand has finally been answered!"

Continued Mr. George, "These books have been updated and are better than ever. I'm greatly pleased with the quality job CafePress.com offers. The covers are beautiful, the print quality is absolutely perfect, and the binding is even better than I could have hoped for."

Two more Atari Times books are soon to be released. "The 2002 Year End Issue will be offered soon and I also have plans to reprint the original 10 paper-based newsletters into a single book. This will allow those who missed out on the original runs to finally have the opportunity to catch up."

The pricing of the 2001 Year End Issue and 2004 Compendium is $14.00. Both books can be purchased at http://www.cafepress.com/ataritimes

More information about The Atari Times books can be found at http://www.ataritimes.com/store/books.html

The Atari Times is a web-based newsletter devoted to all Atari game systems. Updates to the site are on a weekly basis. Visit http://www.ataritimes.com/ for Atari related news, previews, reviews, and feature articles.

personally, id open it up and replace them, I've done it to a friends commodore monitor a few years ago and had no trouble finding replacement pots. worst case you may not find ones that fit where the old ones are and may have to drill holes in the case to install them elsewhere and install generic knobs on them.

In my experience things work with MiNTnet first, then MagiCnet second, so
if it works with MagiCnet, it's almost guaranteed to work with MiNTnet.

>> But as I understood you need MagiCNet for this so you have IConnect clients
>> running on MagiCNet and STinG clients running on MagiCNet as well.

Maybe I missed something with the original post or something but why not
run:

MintNet or MagiCnet as base.
Gluestik on top (which works perfectly with both)
iFusion on top (which works fairly terribly for me, but works nonetheless).

This should in theory work.

Thanks,
mark

Hi Lonny!

L>These problems keep it from reaching a public release I take it?

I don't think so. That's just one client out of five.

Vassilis seems to be quite busy with other things, so I don't know if and when
he's going to issue a new release :-(

With best regards
Ekkehard

3007. GIM Version 0.1 Alpha Released

Newsgroup: comp.sys.atari.st
Date: 2004-05-04 05:41:16 UTC
From: Mark D <mducksub@removenoaspam.atari-source.com>
Message-ID: <pan.2004.05.04.05.41.15.558558@removenoaspam.atari-source.com>
Source record: 18995

Hello all,

Just a quick note to let you know that over on
http://portal.atari-source.com, GIM Version 0.1 Alpha has been released.
This release has been made because of a request of a couple people in the
community. It's primarily for those who are in a hurry to use an AIM
client for GEM. It's NOT DONE in ANY WAY! So PLEASE be nice with the
critique. Also, DON'T bother trying to compile it unless you are
proficient enough that you will not need to ask any questions. I will not
help you get it compiled beyond the guidelines of the readme file, unless
your intention is to participate in future GIM development. This project
is open to new members of a development team, but I retain rights to
accept or reject any code that goes to GIM CVS when it opens. In the mean
time, submit patches to me.

Please understand that I know that this is rediculously inefficient for
VDI routines and riddled with bugs. This is an ALPHA. Please keep your
nasty comments to yourself. Constructive criticism and ideas discussion
can take place on this thread.

Thanks,
Mark

Hi,

It's now a long time ago I was here.
I've just received the last issue of "A Vos Macs" a french magazine
where I can read some people has succeeded tu run Calamus SL under Aranym.

So I downloaded the program and tried to run it .... nothing happens.
And the readme file seems to be chinese for me.
If someone here can help I would be very pleased.

thanks in advance

Jo

You've got probably wrong version from Aranym WWW. Strange that they
haven't changed it yet. Anyway, if you want right version - just let me
know - I can send you one via e-mail. But keep in mind that Calamus
SL2003 light won't run at all under OSX Aranym and older 1995 version
will run but it is impossible to set any object colours (I was trying it
at both - 8 and 32 bit colour).

From: Stephen Moss <sgm23@eng.cam.ac.uk>
Message-ID: <c77n4c$3rf$1@pegasus.csx.cam.ac.uk>
Source record: 18899

I have a couple of STOS extensions that I am unable to use together
due to them both using the same file extension, I seem to recall that
there was a program that would sort and rename them thus resolving any
conflicts.
Just renaming the extensions does not work.

Does anyone remember what is was called and where I might find a copy?

Thanks,
Stephen Moss

I gather that the original problem was that a connection could not be made
with IConnect. Without some idea of the expertise of the OP in setting up
IConnect it's hard to comment further, so suffice to say that setting
IConnect up is much, much easier than STinG (STiK) IMO.

> MintNet or MagiCnet as base.
> Gluestik on top (which works perfectly with both)

3017. GIM CVS

Newsgroup: comp.sys.atari.st
Date: 2004-05-04 22:09:59 UTC
From: Mark D <mducksub@removenoaspam.atari-source.com>
Message-ID: <pan.2004.05.04.22.09.58.468901@removenoaspam.atari-source.com>
Source record: 18906

Hello guys,

Just a quick note to inform you all of GIM CVS.

To use GIM CVS, simply follow the following steps:

```
export CVSROOT=":pserver:anonymous@gim.atari-source.com:/gim"
cvs login
```

when prompted for password, simply press "enter"

then,

```
cvs -z3 co gim
```

You will download a copy of gim then. The information should then be retained such that in order to update your local copy, simply go into the resultant gim directory and type "cvs update". This of course will require a console and MiNT (with the CVS rpm installed from sparemint) or a linux box.

In order to compile from CVS, you will have to link or copy over the faim directory from one of the main gim source archives as aim.h as well as libfaim.a is looked for inside this directory on compiling.

Good luck, and happy testings.

CVS will likely reflect new updates every day at 12:00-3:00am EST, at least as long as I have the energy to work on it daily like I have been.

Thanks,
Mark

OK this is the bad news , the Orgainsational Email .... Read below and answer questions please

1) Are you definitely coming to JagFEST UK ?
2) Full Name ?
3) Aka ?
4) Who else is coming with you ?
5) Arriving Friday or Friday Night or Sat morning?
6) Do you want a hotel room ? If so for what nights and single, twin or double?
7) Willing to share room, if so any preferences?
Do you need a monitor? if so how many and what?
9) Roughly how many power points? (so I can get extension blocks)
10) Can you lend us any monitors...

Upon receipt of the above please answer as soon as possible so I can send you an invoice/bill

If you know someone who should have received this email please let me know

Cheers Guys... please send email to answer, not to this website. It is easier for me to correllate

Nick

3021. ICD to AHDI

Newsgroup: comp.sys.atari.st
Date: 2004-05-05 05:43:38 UTC
From: Brian Roland <BJRoland@bellsouth.net>
Message-ID: <B3%lc.4066$cb.3260@bignews1.bellsouth.net>
Source record: 18908

I've got a Hard Disk that was set up with ICD, or Supra...
I'd very much like to convert the drive to something better liked by HDDriver.
I can't make heads or tails out of the ICD to AHDI utility that came with
HDDriver, it's all in German, which I can't read, and running it through a
translator makes it even worse.

Could someone help?

This is all the docs that came with it:

Informationen zu ICD2AHDI, Stand: 17.03.1996
---

1. Einleitung

ICD2AHDI ist ein Tool, das es erm"glicht, Festplatten, die mit ICD-
Software mit mehr als 4 Partitionen versehen wurden, AHDI-kompatibel zu
machen. Diese Umwandlung erfolgt ohne Datenverlust, man kann die
Festplatte also direkt weiterverwenden!

Man sollte bei wichtigen Daten allerdings trotzdem ï¿½berlegen, ob es
nicht sicherer ist, von der Platte ein komplettes Backup zu machen, um
sie dann komplett neu zu partitionieren.

2. Rechtliches

ICD2AHDI ist nicht Public Domain, Freeware oder "hnliches und darf
daher ohne meine ausdrï¿½ckliche Genehmigung nicht weitergegeben werden!

ICD2AHDI wurde mit grozer Sorgfalt erstellt und eingehend getestet.
Dennoch kann ich nicht fï¿½r die Fehlerfreiheit oder die Tauglichkeit zu
einem bestimmten Zweck garantieren.

Darï¿½berhinaus erfolgt die Benutzung von ICD2AHDI auf eigene Gefahr. Ich
ï¿½bernehme keine Haftung fï¿½r Sch"den jeglicher Art, die durch die sach-
oder unsachgem"ze Anwendung von ICD2AHDI entstanden sind oder
entstanden sein k"nnte.

Zur Beruhigung: Meine Festplatte wurde, bevor sie vor ein paar Jahren
am Falcon komplett umpartitioniert wurde, mit ICD2AHDI behandelt und
funktionierte danach ohne das geringste Problem.

3. Vorgehensweise

Bei der Umwandlung einer Platte, die mit ICD-Software mit mehr als 4 Partitionen versehen wurde (ohne AHDI-Kompatibilit"t), geht bei den Partitionen 3 bis n - 1 jeweils der letzte Datencluster verloren. Das Programm CLCHECK ï¿½berprï¿½ft nun, ob er belegt ist und gibt ggf. die betroffene Datei bzw. den betroffenen Ordner aus. Diese muz dann auf eine Diskette kopiert und gel"scht werden. Aufgerufen wird CLCHECK mit den zu ï¿½berprï¿½fenden Laufwerken, also meist ab E aufw"rts.

Als n"chstes sollte man sich mit Hilfe des ICD-Utilities CLEANUP eine Sicherheitskopie der Root- und Bootsektoren machen, damit man bei Bedarf wieder den alten Zustand herstellen kann.

Nun muz das Programm HDPARTS (auch auf der ICD-Diskette zu finden) aufgerufen werden. Die Partitionsdaten, die es ausgegeben hat, sollte man sich dann genau aufschreiben oder von einer Shell aus auf den Drucker umlenken. Das ist wirklich wichtig, da man sonst Datenverlust riskiert!

Vor der eigentlichen Umwandlung muz zun"chst ein AHDI-kompatibler Treiber gestartet werden (am besten natï¿½rlich HDDriver), da ICD2AHDI bestimmte Funktionen ben"tigt, die der ICD-Treiber nicht oder nicht zuverl"ssig beherrscht (das war zumindest 1993 so, seitdem habe ich nicht mehr mit ICD-Treibern gearbeitet). Dabei ist es unerheblich, daz nicht alle Partitionen erkannt werden, da ICD2AHDI direkt auf die Festplatte zugreift (selbstverst"ndlich muz ICD2AHDI.TOS noch erreichbar sein).

Jetzt wird ICD2AHDI gestartet. Es gibt, nachdem man die Nummer der zu bearbeitenden Festplatte eingegeben hat, die aktuelle Partitionstabelle aus. Diese sollte man genau(!) mit den zuvor notierten bzw. ausgedruckten Werten von HDPARTS vergleichen. Sind Unterschiede zu entdecken, ist eine Umwandlung nicht sicher m"glich, man sollte ICD2AHDI bei einer der folgenden Sicherheitsabfrage also verlassen.

War alles OK, wird die Festplatte umgewandelt. Im Anschluz sollte man auf die betroffenen Partitionen nicht mehr zugreifen. Stattdessen muz jetzt ein AHDI-kompatibler Treiber (am besten HDDriver) auf dem Bootlaufwerk installiert werden (das Installationsprogramm sollte man am besten von Diskette starten).

Danach Neubooten und prï¿½fen, ob alle Partitionen korrekt erkannt werden und ob die Daten noch in Ordnung sind. Wenn nicht, sollte man die zu Beginn mit CLEANUP gesicherten Root- und Bootsektoren restaurieren, wieder den ICD-Treiber installieren, neubooten und die Platte nach einem kompletten Backup von Hand neu partitionieren, diesmal AHDI-kompatibel.

Zum Schluz ein kleines Beispiel:

Am ACSI-Bus des Rechners h"ngt eine einzige Platte (SCSI-ID 0), auf der 6 Partitionen vorhanden sind, die ICD-"konform" aufgebracht wurden.

Folgende Schritte sind durchzufï¿½hren:

1. CLCHECK mit den Parametern E F G aufrufen und alle Dateien/Ordner,
die eventuell ausgegeben wurden, auf Diskette sichern und dann
l"schen.

2. CLEANUP von der ICD-Utilitydiskette aufrufen und die Root- und
Bootsektoren auf eine Diskette sichern.

3. HDPARTS von der ICD-Utilitydiskette starten und die ausgegebenen
Daten exakt notieren (insbesondere Startsektoren und L"ngen der
Partitionen).

4. ICD2AHDI aufrufen und als zu behandelnde Festplattennummer 0
eingeben (ACSI-Ger"t Nummer 0).

5. Ausgegebene Partionsdaten mit denen aus Schritt 3 vergleichen, bei
Unterschieden Programm beenden.

6. Sicherheitsabfragen wahrheitsgem"z beantworten. Bei positiver
Antwort wird jetzt die Festplatte umpartitioniert.

7. Nach der fehlerfreien Umwandlung einen AHDI-kompatiblen Treiber auf
der Festplatte installieren. Das dazu ben"tigte Programm (z.B.
HDDRUTIL) von Diskette starten!

8. Neubooten und Erfolg der Aktion ï¿½berprï¿½fen.

Wer mehr ï¿½ber die technischen Hintergrï¿½nde der Umwandlung erfahren
m"chte, kann in Ausgabe 12/93 der ST-Computer einen ausfï¿½hrlichen
Artikel und die Quellcodes finden.

Sag mal, du kennst dich doch damit aus. Welche Programme gibt es alles die
MagiC Threads brauchen? Ich will das in das neue XaAES einbauen.

Ciao
...Frank

>
In first I thought do the same and try to patch XAAES but it was to hard
for me to do this, because when I do a change in a part on other it
crash! I have near the same with MyAeS but I know exactly what can be
problems on it, I think it's more difficult to take an old AEs than
rewrite one from scratch (XAAES is a good help probably I never be able
to do this without looking to the ASM dispatcher of XAAES), and I not
forget OAESIS that help me to start for some small functions, and
because OAESIS is near from MyAeS than XAAES, that is write for Mint
only. But I have not design a new AES only for do this, because I'm very
happy for my MagicMac, and MyAeS is not as powerfull as Magic at this
time and I think it need a lot of month before do this, but I love AES I
would do this for a long time to learn more on AES (and I learn!),
because there is today no help for developpers to said theim whats wrong
in there software (example EBModel never run on Mint + NAES, it run now
on XAAES but never know why it doesn't run on NAES, with MyAeS it run
and it said why, it's something near WinX concept), third I thing our
world need new usefull function in AES to help to port software on new
hardware because some direct access to special system memory for example
(I use a lot the 200Hz timer for example, I would like an easy
encapsuled way to access this and not have to change a lot my software
to do this), 4th I would like MyAeS be able to run above an other AES
(not very clean because there is no interaction) but enough to debug it
on my system (MagicMac)
and usefull for developpers to run it without installing it if they
didn't want it! 5th perhaps one day!!! I will be able to do a lib from

it witch help us to port our software on other systems, I think it's a way for some important software stay updated for our system.

Now I have to fix a lot of bugs with some hard semaphore problems, and to be able to put into sleep application waiting for event to speed up systems (it's a big problems for me and dilemna because except I think the Beta Mint 1.16 and Magic it's impossible to call from IT gemdos function without crashing system, so I don't know how to do this, there is too that I have no interruption for keyboard)

Olivier

3024. Re: ICD to AHDI

Newsgroup: comp.sys.atari.st
Date: 2004-05-05 09:05:51 UTC
From: Alexander Beuscher <alexb@feanor.schunter.etc.tu-bs.de>
Message-ID: <Pine.LNX.4.58.0405051013350.392@feanor.schunter.etc.tu-bs.de>
Source record: 18911

Hi, Brian!

BR> I can't make heads or tails out of the ICD to AHDI utility that came
BR> with HDDriver, it's all in German, which I can't read, and running it
BR> through a translator makes it even worse.

BR> Could someone help?

I'll try in short.

BR> This is all the docs that came with it:

---cut---

1. Introduction

ICD2ADHI does convert ICD partitioned harddiscs with more than four
partitions into an ADHI compatible partitioning - without loss of data.

But you might consider making a full backup and repartition your HD if
there is important data on it.

2. Legal stuff

ICD2ADHI is not Public Domain, Freeware or similar and thus may not be
handed on without my explicit permission.

- no guarantee for functionality
- no liability for damages
- but conversion of own HD without problems

3. Proceeding

Converting ICD-partitioned HDs with more than 4 partitions (without ADHI
compatiblility) needs the last data cluster of partitions 3 to n - 1
(i.e. usually partitions E, F, G and so on).
The program CLCHECK checks wether the last data cluster of a partition is
in use and if by which file or folder. It has to be applied to each
partition mentioned above. If files or folders have been found they have
to be removed from the partition.

Make a backup of the root- and bootsectors with ICDs CLEANUP utility. If
anything goes wrong you can recover to the unconverted status by this.

Write down the partition data output of the ICD tool HDPARTS.

Start an ADHI compatible driver (HDDriver recommended). ICD2ADHI needs some of its functionality. Be aware that ICD2ADHI.TOS must still be reachable.

Start ICD2ADHI. Enter the number of your HD. Compare the partition table data output of ICD2ADHI with the one written down before. If there are differences, then the conversion is not save, you should quit ICD2ADHI.

The HD now gets converted. Do not access the converted partitions with the old driver. Install the ADHI compatible driver to the HD, preferably from floppy disc.

Reboot and check if all partitions are recognized correctly and if your data is ok. If something seems damaged, restore your root- and bootsectors with CLEANUP, re-install the ICD driver and reboot again. Now you can go the long way: full backup, newly partitioning (ADHI compatible) and recover the backup.

An example:

Only 1 HD, on the ACSI bus, jumpered to SCSI-ID 0. 6 ICD-partitions.

1. CLCHECK with E, F and G. Save all reported files/folders to floppy and delete them on HD.

2. CLEANUP, save root- and bootsector data to floppy

3. write down HDPARTS output exactly (especially start sectors and lengthes of the partitions)

4. Call ICD2ADHI, enter HD number 0 (ACSI device number 0)

5. Compare partition table data output to the one from step 3. If differences quit.

6. Answer safety questions correctly. If no negative answers the HD gets converted now.

7. Install the ADHI compatible driver to your HD. Start the installer from floppy.

8. Reboot and check if everything is ok.

Technical background to ICD2ADHI can be found in the (german) computer magazine "ST-Computer" (Issue 12/93), including sources.

Ah, but there's no networking in IConnect - that's strictly diallup.

It's MagxNet and its gateways that bring in networking and the ability to
access ethernet etc.

Ok, I didn't know (never used MagicNet).. but for MiNTnet with only
dialup, you don't need to configure rc.net and stuff either.

Maurits.

3032. ST Emulators for AGA Amigas

Newsgroup: comp.sys.atari.st
Date: 2004-05-05 18:50:09 UTC
From: kokkiklhs@yahoo.com
Message-ID: <d97adc24.0405051050.a899818@posting.google.com>
Source record: 18917

Hi everybody!
Were there EVER any WORKING & SERIOUS Atari ST emulators for the AGA series of Amigas (A1200 & A4000)?
I've tried the ones that can be found on Aminet, but no success at all, I didn't even manage to get them working on my Amiga 1200 with or without 68040 Apollo card!
I once heard about Chamaeleon-II and Amtari Professional, but almost no infos can be found around the web concerning them!
Isn't it a pity that such a product is not available for these computers?
Back on Amiga 500&2000 days (OCS/ECS), Chamaeleon-I and Medusa were doing the job of emulating a stock 68000 ST with its internal drive and half-meg of RAM, rather well! I remember playing SIM CITY, booting from original ST disk with my plain 1Mb A500, no extra HW added!
And all these in a reasonable performance speed (80-90%)!!
Nowadays, using ShapeShifter and Fusion MAC emulators for long with my A1200, I found out that the emulation is almost PERFECT, I suppose that the same
could be rather easily achieved with ST emulation, since the processors are in fact of the same kind, especially with the TT and Falcon machines!
If anyone has info about *SERIOUS & USABLE* TOS emulation for AGA Amigas, please tell me, I would be grateful!
Long live ALL 680x0-based systems ;-)
!!!NO MORE RIVALS - JUST ALLIED FORCES AGAINST WINDOZE BOXES!!!

> :-)

Yes, and there is one interesting thing about the Pegasos board that
might be of interest to those that are looking at creating a TOS
compatiable system and that is the Morphos OS that comes with the
board.

It's not a AmigaOS compatiable system per se but a microkernel system
that has an amiga compatiable service and uses a built in jit 68k
compiler to run legacy software, since this is a PPC based system
there is no speed penality with a MK system like there is with an x86
(PPC switches 10x faster than an x86) and since it already has a 68k
jit why not just create an Atari compatiable service for morphos
rather than a TOS compatiable OS ?

That would be a lot less work and would mean that you could run TOS,
Amiga and Morphos software at the same time, the compability would not
be 100% but it would be lost less work since there would be no need to
create the basic OS itself etc etc etc. Over time the compability of
the system could be enhanced etc

3036. VNC Atari

Newsgroup: comp.sys.atari.st
Date: 2004-05-06 07:21:31 UTC
From: Mark D <mducksub@nossspamXXatari-source.com>
Message-ID: <pan.2004.05.06.07.21.16.889520@nossspamXXatari-source.com>
Source record: 18921

Hey everyone,

Just a line to let you all know I ported VNC 3.3.7 to MiNT/Atari. The viewer (only so far) runs with the GEM x server and required some magic tweaking to get built, but nothing really too extreme.

What might come as a bit of a shock is that this awful piece of software that can run slow on some pc's just happens to run beautifully on the GEM xserver. It's *really* fast. Tonight I did my accounting with gnucash from my falcon over vnc! The link is faster using my falcon as the client and my pc as the host, than it is using my pc as a host and vnc'ing in from work, and we have a cablemodem so it's not exactly slow. I'm really quite impressed.

Of course, we all know vncserver will be a lot more useful when I get around to it, that way we can USE our Atari's from remote ;-).

Oh and of course, the obligatory screenshot:
http://toad.atari-source.com/~mduckworth/vnc1.gif

Thanks,
Mark

The apps you've mentioned have all been developed in a period where there
was no such thing as "having choice". There was TOS and MagiC, in Germany
where 90% of these apps originate from everyone thought that MultiTOS was
a 1st april joke from Atari...

>On any other AES, CAB's icon masks just look ugly and strange. And I've
>dealt with ROM on the Papyrus issue, and they won't budge.

Sure, but it's a pure cosmetic problem. Coloured or monochrome icons won't
affect the way that the program works.
IMO an AES should be at least backwards compatible, and then all these
small irritations wouldn't be necessary, a programmer could for example
use the system function "appl-getinfo" to find out if MagiC objects are
used, and if that is the case use MagiC objects also under the new AES
instead of userdef objects. I realise that this is not a very satisfying
solution, especially for the programmer, but for the user it is ideal.

>I also thought of some other things to add, like non-blocking
>drop-down menus, so that programs can continue running when they are
>opened, and MacOS X- and Windows XP-like shadowing effects behind
>anything displayed on screen (i.e. menus, windows, icons, etc.) for
>machines fast enough to handle it.

This issue involves more then a fast machine. I'm not a programmer but
I've read and translated a lot of programmer docs. Some of the things on
your list are possible, some programmers even scratched the surface to
see what is possible... NVDI from version 5.0 onwards in combination with
WDialog makes a hell of a lot possible. The problem IMO is that the "new"
generation of programmers either don't know anything about this or are
simply not interested in implementing it all. It's time consuming and the
user *must* have NVDI 5.xx also of course.
In Jinnee for example when dragging icons, you'll see that they get the
transparant state, and when in text mode, the text while been dragged is
transparant also. In the last beta version (never released), the author
took it a little further, windows could more or less be dragged over one
another while being transparant... and then there's Xgem, at this very

moment the current version offers shadowed and transparant effects for stuff in the windows, window borders and menu's. Combine Jinnee with Xgem and you are almost there.
Non blocking menu's are possible also, but this is a OS specific thing, in MagiC you can see two examples of this, the MGcopy program of Magxdesk and IConnect... both programs run in the MagiC threads. And all kind of text effects can be applied to proportional TTF fonts from MagiC 6.1 onwards in combination with NVDI 5.0 and WDialog.

Last week someone here wanted to know if it's possible to display pics and icons in 16 and 24 bit on the desktop, Jinnee under MagiC 6.1 for example can do this, but only if NVDI 5.xx is available. The colour palet is automatically adapted to the resolution, same thing for the icons. And Icons can even be dynamically made smaller & larger to always be displayed at their most ideal size, in whatever resolution. AFAIK this has not been implemented yet in any of our apps, but keep an eye on TempusWord NG, the next version will support this type of icons in the icon bar...

I'm not saying that everything is possible with NVDI 5.0, but so far not one programmer yet has really looked into all the possibilities it has to offer. Some "fooled" around a little, and others like already stated have scratched the surface. But these people are gone... so it's up to the remaining programmers if they want to implement this kind of stuff, after all, it only enhances the visual aspects of a program and/or desktop but does nothing to the functionality. I remember from the time that apps like Jinnee and Emailer were developed, that implementing only small portions took ages, so it's a time consuming business. From previous posts with some programmers here I remember that they don't care much for the visual aspect, I've lost count of how many times I've been blamed here for liking and using "pretty nice" looking stuff.

BTW: don't be blinded too much about all that pretty nice looking stuff on OS X and XP desktops, once we talk about functionality they're both crap. Jinnee in combination with Scripter leaves them both far behind. Steve and Bill should drop by once and see what a real desktop is made off, it would not be long before their stuff is enhanced...

Cheers from Belgium
Dennis

Source record: 18928

From: Mark D <mducksub@removenoaspam.atari-source.com>
Date: Sat, 01 May 2004 19:01:40 -0400

Hi Mark,

>Now *that* is why atari is where it is. Because it's reasonable for
>graphics card drivers to cost $100 right?

Atari has very little to do with it IMO, disregarding the fact that no one ever asked money for such a driver on this platform, has it ever occured to you that some people here would actually be *willing* to pay for one? And if tomorrow someone would announce a driver for i.e: a Radeon 7000 PCI card and ask $100 for it, I would jump on it immediately.

I take that back, I forgot about the Eclipse horror story! But then that's an example of how not to do things. When asking payment for such a driver the least to expect is that it works of course...

>Especially when other platforms give such things away for free. (That's
>just an example... I hear the amiga world is even worse in this respect)

Competition is the deciding factor here, if i.e: Epson would "give" free drivers with their printers while HP and Canon expect to be payed for these, not a lot of HP and Canon devices would be sold anymore... giving away these drivers is equal to holding or enlarging ones market share.
Most of these drivers are not very good either, if they were, then how do you explain people *paying* for stuff like Norton ultilities, Nero, Toast, Vue scan etc...
Linux users are more or less in the same boat, a lot of devices don't come with free Linux drivers, and there's no option to buy them either. Unless someone construct the drivers, they have zilch, just like us. Once however that the larger manufacturers start providing Linux drivers, it will be question of time before the rest follows suit, they'll have to if they want to sell their stuff to Linux users.

>In a prior time sure, that might have worked, now anything software-wise
>really should be done for free.

Well, on paper that looks good and it sounds OK also, in practice however it doesn't work, buy a new scanner, printer, CD-RW etc, and you'll soon find out what I mean. That's assuming you find a device that can still be connected to stock Atari's of course....
Both the Hades and Milan have PCI slots, I once had visions about filling them up with all kind of nice goodies, but I'm a bit more down to earth in the mean time.

>There's no money left to be made on this platform. And there's just
>not enough people left to re-implement quality software like Emailer,
>Fiffi, and all the likes. But the attempt is there.. Highwire is shaping
>up, Troll is quite nice, etc.

No one is saying the opposite, but IMO this is a different issue. Drivers have *always* been neglected on this platform. The times have changed also of course; Linux, Windows, OS9 and OSX all come with heap of drivers as standard, if Atari would still be around then without any doubt MultiTOS 11.06 would come standard with drivers for USB, graphic cards, printers, Firewire, networking etc also...
Should we blame MagiC and MiNT for not supplying these?

But seriously, this is an issue that needs to be addressed, because the absence of *needed* drivers will influence what happens to this platform. Atari computers are not build to last for ever, but they're build to last a pretty long time, and that's much longer then the life span of most cd-r's, hard disks, scanners, printers etc...
The guy(s) who manages to come up with a USB and/or Firewire solution for this platform, deserves a place in the Atari hall of fame. Personally I don't give a damn if that solution is free or costs money, if the developer wants to be rewarded for his time & work, I'll gladly pay for it. And I'm quite sure that I'm not the only one here thinking like this.

While I'm at it: like a lot of people here I'm prepared to pay for a lot of things, the fact that something is free or not is not the deciding factor, "do I need it?" and "can I use it?" are the deciding factors. If money is asked one also has to ask the question "is it reasonably priced?". If I can say three times "yes", I go for it... If a free solution is available and offers more or less the same functions that I need, I'll go for the free solution of course, an example of this is SPIN! vs ExtenDOS.

To be a little on topic: like with anything new that is released on this platform I asked myself the deciding questions, and the answer was twice a "no". I do not need a instant messenger, but if I did and GIM would be an Iconnect client and have the commercial status, my cheque would be in the post... I'm not saying that GIM should cost money, but if you would charge money for it, and I needed it....

Cheers from Belgium

Hi Frank,

>Sorry, but I do not agree. There are better programs for Email and FTP and
>most of them are free.

The beauty is that you don't have to agree :-)
That's what USENET is all about, if we would all agree with each other this
would be a very dull place. In the good old days this group used to thrive
on discussions.

>I recommend aFTP for FTP and CAT for email/news but you can also give
>aMail, MyMail, Marihuana Mail or Newsie a try.

Ah.... now I don't agree :-)
If you say A, you have to say B also...
I really would love to find out what makes aFTP so special that I can trash
Fiffi tomorrow.
As for email/news, at this moment I have some 180Mb post/mail stored in the
database of ASH Emailer. Can any of the stuff you recommend manage/sort some
35.000 messages? And if they can how long will it take....
Oh and are any of those alternatives by chance Scripter clients? If not then
there's no way you can convert me! It's a bit like kissing the first girl in
your life, once you've had a taste, you're hooked. I will never ever give up
the advantages of using Scripter while doing internet stuff.

Cheers from Belgium

Hi Cyril,

>your answer is so ironical. If you know to read, I noted that I am not a
>coder!!!

You don't need to be a coder!
I've explained to enable the PRO mode in IConfig and apply some trial and error tests to it. And there's no irony in that... If you have no problems connecting with STiNG, then simply transport the STiNG default values over into IConfig, and retry... If you have a problem logging in, then try the manual override feature, and if you have no idea about what your ISP expects, then dial in using telnet and take a peek. The "PRO" mode is not really a very suitable name, I like to think of it as automatic and manual modes. For 95% of the users Iconnect will make a perfect connection in automatic mode, the manual mode is for those 5% where things don't work out... about everything that can be configured to a stack is configurable, as far as flexible goes, no other stack on this platform comes even close, not even MiNTNET.

>If you are so ironical, don't answer or don't read...

But you should have read the interesting bits, the irony is exclusively for Conny, she happens to love it! :-)

Cheers from Belgium

Hi,

Excuse me for my bad english :-)

I agree with you. But, for me, MagXnet and Iconnect can't resolve hosts if my speed connexion was at 40 000 and 42 666 bps (the max on my line). With Sting I have no problem, the connexion is ok with any speed. With Sting, i have access to a lot of client (sitng/Stik2 and draconis) but an access to Iconnect client is not possible. My provider is Free telecom, in France. Note : With Iconnect AND Magxnet : it's the same problem. Why ? I'm ready to change Sting to Iconnect or Magxnet, but I don't understand why doesn't work... With Iconnect, I try to modify the MTU configuration, but no result...

Regards,

Cyril.

MyAeS do this for all software, with sometime some redraw trouble! but
it's MyAeS bug, so to fix. I like see gemdemo runing and display menus
in the same time! It's cosmetic things, but funny.

I agree on that, but there is another problem, its not meant as provocation: how to use Magic objects etc in some new AES, if Magic AES code is protected and source not released? Is there a detailed explanation of those objects, how to implement them on AES level. Programer's guide (for AES not client apps) or something like that? Same or course N.AES but i don't think N.AES introduced own objects etc...

> some programmers here I remember that they don't care much for the visual
> aspect, I've lost count of how many times I've been blamed here for liking
> and using "pretty nice" looking stuff.

Common Dennis, stop that.. "NAES is crap, look how Texel icons look shitty" and so on, is not that we blame u to like nice look, we blame u on calling some application a crap, not to mention what many coders were called, due to mainly cosmetic problems.. Stop introducing history on and on, and not display yourself as saint. And then we may go on in some constructive debate. I can talk for myself, and prolly for many others, that u never was blamed cause u like the look, but how u rate apps u hate, where suddenly look (since no other functionality was missing) was the most important stuff... I don't like N.AES cause it look great, i love it because N.AES/Thing/Taskbar/F1 combo offers a lot of small things (like dclicking arrows, use left/right mouse button on arrow to reverse scroll, great drag'n'drop via F1 or taskbar...) which really make life a lot easier. Didn't notice those things on windows/macos which i use a little or Linux/KDE which i use a lot. Its the feeling before look, otherewise id prolly stuck in MacOS.

:-(
I had Emailer running under MiNT with IConnect so it seems that
Emailer doesn't need MagiC. :-)

>For me, MagiCNet is working fine and is more stable than STinG was. And
>I don't use Iconnect clients either, except for testing.

For me it's the same with MiNT-Net. MiNT-Net is rock solid.

And yes, you are right. There is no need for IConnect clients. There are
better alternatives for MiNT/MagiC-Net. But it might be interesting to use
IConnect clients just for the fun of doing so. :-)

Well. For me there are two reasons:

1.) It's free, for Fiffi you have to pay
2.) It works with MiNT-Net and N.AES (Fiffi works neither without IConnect
nor with MiNT)

>As for email/news, at this moment I have some 180Mb post/mail stored in
>the database of ASH Emailer. Can any of the stuff you recommend manage/sort
>some 35.000 messages? And if they can how long will it take....

Well. I am using CAT and apart from that fact that it is free as well it
sorts Mails (at the moment I have ~10.000 mails just only in
comp.sys.atari.st) in a fraction of a second. The database is approx. 50 Mb.

>Oh and are any of those alternatives by chance Scripter clients? If not

Of couse, CAT is. Since version 4.07 (current is 5.35, version 5.36 is due to
release next week).

Any questions? :-)

>give up the advantages of using Scripter while doing internet stuff.

There's no need to give up good behaviour. :->

Well as this thread suggests, its sting<>iconnect translator, which is
proper term, emulator is not totaly proper one.
```

Personally, the STiNG Draconis client never worked properly. Once a
data packet was dropped (which was every few seconds with STiNG), the
Draconis client refused to continue it's download after STiNG
reestablished the data stream. The MagXNet Draconis emulator doesn't
seem to have that problem.

> My provider is Free
> telecom, in France. Note : With Iconnect AND Magxnet : it's the same
> problem. Why ? I'm ready to change Sting to Iconnect or Magxnet, but I
> don't understand why doesn't work... With Iconnect, I try to modify
> the MTU configuration, but no result...

I'm not sure how I-Connect works in this regard, but I know that
MagXNet gets it's MTU setting directly from the ISP upon connection,
rather than a user setting. Perhaps I-Connect is doing this, too? I
think it is a standard PPP function. I believe manually changing the
MTU setting is mostly a SLIP necessity (although I am not 100% certain
of that).

You know, I think many problems that people complain about with these
programs has a lot to do with ISP's. For example, a few years back, I
had an ISP on which everything worked more or less. I used STiNG, STiK
2, and my Mac. Then they were bought out by another company, and
suddenly STiNG stopped working properly (although it had always had a
lot of trouble with dropped data packets, which caused long,
annoying pauses in downloads and many timeouts). I got MagXNet and it
seemed to work pretty well (and had fewer dropped packets), but not as
well as STiK 2 (which I couldn't get to drop a packet if my life
depended on it). Then that ISP was bought out again, and suddenly
STiK2 stopped connecting. Then, a few months later, MagXNet started
having trouble. I switched ISP's, and MagXNet started working again,
even better than before, and STiK 2 would actually connect, but would

immediately drop the connection within seconds. Now, within the past couple weeks, my ISP changed servers, and now both MagXNet and STiK 2 work perfectly (haven't tested STiNG yet), but now my Mac isn't holding on to a connection for more than a minute or two. In every case, each of the programs were set up exactly per the documentation and ISP settings. So now, if I have difficulty, I'm much more apt to blame the ISP than my software settings, especially since in many cases, I didn't even touch the settings when something went wrong. So your problems may lie on your ISP's end, whether they admit it or not. I once had a lengthy discussion with my ISP tech support for weeks about difficulties I was having. we went round and round with me implementing their suggestions, while they completely ignored or refuted my initial instinct that the problem was on their end. It took the tech support that whole time to finally admit that my original impressions that something was wrong on their end, were correct.

Yup. At this very moment, even. pppd to call my dialup provider, and
telnet to a shell host, and I much prefer it to a STiNG connection. The
only thing not mentioned was one word in the host file, "passive" so MiNT
will wait until the dialup host gets around to starting a ppp link.

I like MiNT, and find it useful. Have never seen MagicNet, running or not
running.

Jim

Yes, there are good descriptions of these objects in the Magic programmers
documentation.

> (for AES not client apps) or something like that? Same or course N.AES but
> i don't think N.AES introduced own objects etc...

It did... It also supports most (all? Not quite up to date now, I haven't
used my Milan for a few months) of the new objects introduced in MagiC.

3065. Gaim and cyrillic

Newsgroup: comp.sys.atari.st
Date: 2004-05-06 20:00:44 UTC
From: Frank_Szymanski@du3.ohse.de
Message-ID: <20040506220044.a8130@du3.maus.de>
Source record: 18850

Hello,

I am using Gaim 0.59.9 on my ATARI with FreeMiNT. First of all I want to thank Mark for his work. It's a really nice port.

But when using it I couldn't manage to send or receive cyrillic messages although I have both cyrillic fonts for X installed as well as fonts with cyrillic characters under GEM (Unicode true type fonts - they work well in Papyrus).

Anyone out there who can help?

Regards,

Frank

From: Sylwek <sylwekp_WYKASUJTO@pf.pl>
Date: Thu, 06 May 2004 14:32:56 +0200

Hi Sylwek,

>MagicDesk and Jinee?

No...

Jinnee doesn't use threads at all, if it did it would only run under MagiC
and the same thing applies to magixdesk. In magixdesk however there is one
utility that uses threads: MG Copy.

AFAIK there are only four official released applications that use these
threads:

MG Copy (Andreas Kromke)
IConnect (Sven Kopacz)
Chatter (Jurgen Koneckzny)
Battery (Manfred Lippert)

The advantage of running in threads is obvious, but the negative side is
that apps are OS specific when using these, so hardly anyone implemented
this. I presume that the same goes for MiNT threading.

Cheers from Belgium
Dennis

Hi Hugo,

>I have still some Signum III documents which I would like to convert to
>another format:
>such as rtf, tex, postscript ...
>Does anyone here know of programs which can perform this task (please
>mention under which operating system those programs run)

AFAIK the Signum III format is not supported by any other popular word
processor and the program itself only has the option to save the text in
ASCII format.
IIRC in the tools folder of Signum 3 & 4 there is a small utility called
ASC_KONV.TTP, it was written by Oliver Buchman and will keep some of the
text attributes and formatting intact. But don't expect any miracles...
The TTP should run on any Atari and OS, including the various emulators,
if you don't have Signum 3 anymore, just drop me a mail and I'll send
the TTP over...

Cheers from Belgium
Dennis

Frank,

Old versions of GAIM don't support international text as far as I know.
The most recent versions of Gaim, GTK and Pango do, but the ports are not
100% complete yet. Well in fact they ARE complete but the completed Gaim
binary won't run with our X server. So we need Ralph Lowinsky to fix the
X server, only he's working on Highwire which as a native gem application,
I personally consider way more important.

My girlfriend is Russian though so I could have her look into the Cyrillic
support for you.

That's the status there ;-)

Thanks,
Mark

Thanks for your answer mike.

But, I don't undestand why it's ok for Sting, Wensuite and Draconis connexion, and it's ko for MagXnet and Iconnect connexion. I try the pro mode and the MagiC-Timeslice but with no conviction.

3079. [CT60] TOS archive 1.01

Newsgroup: comp.sys.atari.st
Date: 2004-05-07 11:23:57 UTC
From: NOSPAMS@wanadoo.fr
Message-ID: <1gdf35e.ctskdwlx3qv0N%NOSPAMS@wanadoo.fr>
Source record: 18868

Hi, the CT60 TOS archive is updated, no changes inside the TOS, but
there are a new feature inside the flash :

There are a boot menu (after the disk driver is loaded) if the entry of
the favourite OS inside CT60CONF.CPX is <> '-'.
You can select TOS, MagiC or Linux, value is stored inside the NVM.
- With MagiC the ct60tos try to found magic.ram inside the main
directory of the boot folder. So you don't need magxboot.
- With Linux the ct60tos try to found bootargs inside the main directory
of the boot folder. So you don't need ataboot. Tested with the kernel
2.4.25 (on my site).

Sure you can always use magxboot.prg or ataboot.prg inside the AUTO
folder.

http://ct60conf.atari.org

Regards,

Didier.

I may have the opportunity to purchase a ct60 but.....it comes with everything except cpu and memory. I think it also comes with whatever software/drives comes with ct60.

What do you all think.....should I buy it?

Thanks everyone....your opinions, experience, knowledge, and wisdon are always welcome.

> changed extension letters for you :)
>

I will try this at the weekend but I don't know why it should work as
I would have thought the problem is with STOS not the BAS file. For
example if I place two STOS extension into my STOS folder eg Extra.EXE
and Falcon.EXE then STOS will only load one of these extensions and
not the other as they both have the same file extension.
Changing the file extension does not work, it has just occured to me
that this may be because there is some reference to the file extension
within the extension file itself that STOS picks up. I might be able
to find and change it using a disk editor.

If your staying overnight at JagFest UK 2004 you might get a chance to
see and ridicule an extreamly rough verion of my first game during the
evening session.

Steve.

Sam,

Get the RAM in any PC store for probably $10 or so, and I can give you a
68060EC@66MHz or a 60MHz full 060 with a BROKEN fpu. When I say broken I
mean it gives incorrect calculation results. This is bad for me because
I like falcon demos that use the FPU, but in all honesty, there's NOT much
software that uses FPU. Even Openssl/Openssh which *requires* the fpu,
works perfectly, so at least some functs work perfectly. But you want a
full versus an EC because things are weird with an EC, even if you don't
need the FPU. I can't get the EC to boot latest freemint kernels, the
Ethernec ethernet doesnt' work because the cartridge port doesn't work
with the EC!, etc.

Because this processor MUST be clocked at 60MHz or lower (it's not
overclockable without probs under heavy use), and because the FPU is is
wonky on it, this chip really isn't worth much of anything, however you
can use this as a stepping stone to hold you over until you find a source
of E141J mask 060. This is one of the later 060 that is very
overclockable - it's what you want ;-) You'd be amazed at the difference
between 60MHz and 90MHz ;-)

For some reason the GEM X server for me displays everything in red. I've long tried to figure out this problem and never have been able to. I've since given up ;-). It does this on every platform I've ever used it on. TT, Aranym, Falcon. I use N.aes and mint. It's funny you should mention it though, I don't even notice it anymore I'm so used to it.

Thanks,
Mark

You program can only be using one extension at a time (I assume) so one extension will have no referance in the BAS file, in which case you just rename the last letter from EXE to EXF or whatever. Note you will also have to have the compiler extensions renamed also.

It sounds like you have used one extension and want to use commands from another, just rename the one which you are not using to another letter and you will be fine.

The best way is to load up your program with the extensions which work (again I assume you have only got as far as using 1 extension so far) then save it as a ASC file. then rename your extension and re-load the ASC file, STOS will then rename the commands if they have moved extension letter, for example EXTRA.EXE could change to EXTRA.EXH if you did this then in your BAS file you would get something like "**extension E##" which was where your EXTRA command was, saving as a ASC file will force STOS to re-map these commands to the new extension letter.

Hope this makes sence, ive used STOS for years though not for the last 4 so im a little rusty on explaing things ;-)

Chris

Well i don't find that difference so big.. i have rev6, and at 100 it rarely throw an arbiter problem and freeze... Difference is not that big so i rather run it at 66 :) The problem is solvable quite easy, but again, i don't find it that faster that i would rush to do the fix :)

And i mainly use so hated and "lamers language" GFA, so compiling speed is not that important to me, i press "run" and off we go ;))

3093. HDD + CDROM Problems...

Newsgroup: comp.sys.atari.st
Date: 2004-05-08 04:13:52 UTC
From: hearena@advancedsl.com.ar
Message-ID: <a347a87b.0405072013.13721c8e@posting.google.com>
Source record: 18881

Hi,

Well, this was a bad night. Many hours trying to install a CDROM drive on my 1040STfm with no luck. Let me explain,

1. I have a Link II SCSI adapter conected to an external case with a 320MB SCSI hard drive. It was working alright (till today)

2. Now, I added another external bay with the CDROM, so I got the system as follows:

1. ICD Link II -------> 2. 320MB HDD ---------> 3. CDROM

Configuration summary:
1. HDD is ID 5 and CDROM is ID 3.
2. HDD has termination resistors off and Termination Power ON (the Light on the ICD is on, as always).
3. CDROM has TERMINATION and TERM POWER OFF. Parity OFF as the HDD.

When I turn on everything, the Atari wont boot from the HDD. So if I use a floppy disc, it loads ICDBOOT.SYS and sometimes it finds all the partitions on the HDD (C, D, E,F) and sometimes it only finds C and D for example...

It's just so weird!!! I don't know what to do. Am I missing something? Why it wont boot from the hdd!!!??? Please help me because as soon I solve this problem, I'm sure I'll have to start spending hours trying to make the CDROM to work...

Any idea?

Thanks!!!

Roderick Hero

With HDDriver (example):

ID7 ID1 ID2
Termination OFF Termination ON
Termpower ON Termpower ON
Parity OFF Parity OFF
ICD Link II -------> 2. 320MB HDD ---------> 3. CDROM

> When I turn on everything, the Atari wont boot from the HDD. So if I

First start SCSI chain, after few seconds, start your atari

> use a floppy disc, it loads ICDBOOT.SYS and sometimes it finds all the
> partitions on the HDD (C, D, E,F) and sometimes it only finds C and D
> for example...
>
> It's just so weird!!! I don't know what to do. Am I missing something?

Your CD drive need an driver like ExtenDOS, SPIN ec.
(First is the best!)

Both, hd and cd must be found with the scsi ids. If not, check scsi
cable, termination, parity.

> Why it wont boot from the hdd!!!??? Please help me because as soon I

I canï¿½t say anything about ICD devices and drivers.
Save desktop.inf to C: and the C: partion must be marked as boot drive
on ICD hd driver. (Save to C:, not on floppy disk) Thatï¿½s all.

Regards, Robert

Facundo,

You say Termination in off on the HDD and ON on the CD. Is there actually physical resistor packs on either the CD or HDD? Why is the termpower ON on the HD drive, and OFF on the CD? I am assuming the from your diagram the CD is the last in the chain. Try it the other way round. On my Falcon, I have a 1GB JAZ on ID0 term OFF, and the CD drive is chained to the JAZ, ID6 term power ON. It works perfectly.

Also, I dont know about ICD but on a lot of SCSI PC systems, the HDD that you boot from needs to be ID0. I know that my 1GB JAZ will boot from whatever ID I put it on the falc, but thats with HDDriver, which is a much better SCSI driver. I tend to put all harddrives from ID0 upwards, and CDs/Tapestreamers from ID6 downwards.

Coda.

Does the CD have termination ON or OFF? The device which is physically
last on a SCSI chain should have termination ON or have an exteranl terminator.

>HDDriver, it's all in German, which I can't read, and running it through a
>translator makes it even worse.
>
>Could someone help?
>
>This is all the docs that came with it:

I had the same problem when I wanted to convert my STe's hard disk
from ICD to HDDriver. I could not get the hand of the converter
either, so I ended up backing up my STe hard drive and installing
HDDriver and then put everything back. It was extra work, but now
the hard drive runs MUCH better with no errors.

What CD rom driver are you using? I have the same setup for my STe
except I am using HDDrive and not the ICD software. I also use
Extendos Gold to drive my CD Rom drive. Does the ICD software
acknowledge the CD drive when it boot? If not, it may be the Link
cable. That is what happened to me. For some reason, my Link cable
was bad and had to be adjusted.

There is not resistor pack on the hdd. Isnt enough with only one
device of the scsi chain giving term power?

Btw...
Cant swap drives, because the hdd case has a chain output and the
cdrom case does not. Ill try using hdd as scsi id 0.

You definitely have a termination issue from your description. Check your
cables too! Try just the CD and just the HDD again.

Thanks,
Mark

3103. GIM Website Now Open

Maybe you should still consider buying it then. A Falcon w/CT60 will run
everything that runs on a stock Falcon (whether in 060 or 030 mode), A Hades
is not that compatible.

Ok,

Then I'll work on GIM. can you explain to me the method of entering
cyrillic characters. IIRC the cyrillic alphabet has similar to 26 letters
just like English alphabet, so do you just replace keyboard with cyrillic
keyboard? How do you use it with GEM. Is through an input method editor
of some sort. Is the problem primarily in sending messages or receiving
them that support needs to be added?

Thanks,
Mark

>>>Cyrillic support for you.
>> That would be really phantastic.
>Then I'll work on GIM.

First I want to say thanks in advance.

can you explain to me the method of entering
>cyrillic characters.

Well, there are different ways. In Papyrus there is a dialog where you can see the cyrillic characters in Unicode at position 1024 (hex: 0400), so I use the mouse to click on each character I want to have in my letters. :-)

But there is also a different way of entering cyrillic letters. It's called: ckbd. It's a little program for the AUTO folder.

>IIRC the cyrillic alphabet has similar to 26 letters
>just like English alphabet, so do you just replace keyboard with cyrillic
>keyboard?

No. There are 33 characters. But you are right, I have little stickers on top of each key of my keyboard so I've got the official cyrillic keys on my keyboard as well as the German layout.

>of some sort. Is the problem primarily in sending messages or receiving
>them that support needs to be added?

Of course both directions. :-)

Regards,

Frank

No, When I can get the Xserver right the colors are correct. All X
programs are displayed with improper colors equally.

Thanks,
Mark

3116. GIM 0.2 Alpha Released

Newsgroup: comp.sys.atari.st
Date: 2004-05-10 17:11:40 UTC
From: Mark D <mducksub@removenoaspam.atari-source.com>
Message-ID: <pan.2004.05.10.17.11.40.274256@removenoaspam.atari-source.com>
Source record: 18805

Hello everyone,

Just a note to let you know that GIM version 0.2 Alpha Released. After I created the release number I decided that it really shouldn't be incrementing so quickly or else I'll hit a 1.0 release way before I should so from now on the releases will be incrementing in 100th's increments, i.e. the next will be 0.21.

Everything is available over at http://gim.atari-source.com.

New features include:
* Hidden password entry upon login
* Improved text entry routines
* Multiple line output in the conversation window
* Word wrapping in the conversation window
* Text attributes in the conversation window

A couple other minor fixes and such. This release makes things a bit more useable as far as typing in a line of chat is concerned. Also with the word wrapping you really can hold a conversation now because things aren't always getting cut off, that's why I decided these changes are release worthy. Please test away, feedback to the email address listed, just remove the "removenoaspam." from the email address, OR use the "Contact Us" menu entry on http://gim.atari-source.com.

Thanks very much,
Mark

This might work, but I'd advise trying Termination ON on BOTH drives.
The ICD Link, IIRC is not a terminator. Also, I think that your HD
needs a LOWER number than the CD. This is because the ICD driver
(again, IIRC) attempts to boot from the first ID number it finds. I
have a setup that has an internal drive set to ID 1 and and external
set to ID 0. If the external isn't on, the internal drive boots. If
the external is on, then it boots. Unlike HDDriver, I don't believe
that the boot order for ICD can be changed in software. Even if it
can, I'm sure that's not the default setting.

Agreed. SCSI cables can be fragile, and I've had some that once
worked fine stop working once I had moved them across the room. I
suppose something in the connectors became damaged, but the point is
should termination not be the solution, try new cabling. Also note

that you will need some sort of CD driver to actually use the CD-ROM.
(I use ExtenDOS myself.)

Once you get the hard drive working reliably, run the utility software
(... HDUTIL, ICDUTIL, ICDTOOLS ... I can't remember the name of the
program exactly). One of your options will be to make partitions
bootable.

Hi!
I finally have a Falcon! :)

BUT!! the psu is for 110V (it say 117V 1A. so i guess it takes 117 Watts)
My problem, is that we use 220V and i dont want to use a converter every
time (are really big).
I take out the PSU, and it seems was build to 220V.. but changed to 110.
Anyone has schematics of the PSU ? i want to modify it, and let it working
on 220.

Ah.. i also have 2x 520ST and 1040STfm ... those have similar PSU ?

You could put it in series with a 150 watt 120 vac light bulb. A light bulb makes a pretty good dropping resister and it's economical.

I do not have a Falcon. I have the Falcon service manual, and all it says about the power supply is "is configured". Look at it closely, and you will probably find something like a marked jumper. Do not forget to change the fuse, to one of about half the current.

In other words, Atari's service informantion does not have a schematic of the power supply. This seems like a do-it-yourself job. Good luck.

The Falcon has a switching power supply. Again by the book, the 520ST has a linear power supply, and the 1040ST has a switching power supply.

The visual distinction is probably a switching transistor, wrapped in insulation, strapped to an aluminum heat sink near the transformer.

Yeah, it is "configured". but not with a jumper.
It seems that originally it was designed to 250V (the fuse, and some other parts, are marked 250V.) but changed to work at 110V.
A big capacitor says 200V , and the transformer, says 117V 0.9A. I think, im pretty much screwed.. cause to make it work at 220, i need to change the transformer, to deliver 12V 0.2A and 5V 7A from 220V.
Well... meanwhile, i'll use an external converter ...

Hmmm. One normally changes the output of a switching power supply by
changing the input frequency, over some range of values, unless the iron
saturates. Somehow, they halved or doubled the chopper frequency, probably
by changing a capacitor value.

BTY, I sort of know the situation. I have an English external floppy
drive, with a linear power supply, and if I want to use that thing, I need
a power convertor.

No, not at all - at least on mine.

> Do not forget to change the fuse, to one of about half the current.

Mine is a 250V / 2A Fast... so it should be 4A Fast for 110V...

Hi Galen,

G>Also, I think that your HD needs a LOWER number than the CD.
no, the logical numbering and the physical sequence don't interfer at
all.

G>This is because the ICD driver (again, IIRC) attempts to boot from the
G>first ID number it finds.
That was (and still is) true for AHDI.

G>I have a setup that has an internal drive set to ID 1 and and external
G>set to ID 0.
Unusual, but possible.

Und TTschï¿½
ps

Logic Audio for the Falcon was emagic's attempt to combine their midi
program with Audio. I even have their brochure. But if you try and use
it on an ordinary Falcon you probably would find it unuseably slow. So
I am offering these manuals to anyone on the chance that they still
use Logic Audio Falcon. Cubase Audio works on a CT60 and its pretty
darn good!

Hi Frank,

>>That's what USENET is all about, if we would all agree with each other
>>this would be a very dull place. In the good old days this group used to
>>thrive on discussions.
>
>Well, sometimes I got the impression that a little bit less arguing would
>help the ATARI scene more. :-)

I don't think so. Arguing has never stopped me to help someone out. And as
far as the scene is involved, IMO it's only a very small minority who
posts here. The largest group of programmers don't even read or follow the
newsgroups at all. And the same applies to the German groups.
We may like to think that we influence the scene, but in reality....
BTW if a programmer can't handle criticism (good or bad) he should reflect
on this.

>>I really would love to find out what makes aFTP so special that I can
>>trash Fiffi tomorrow.
>
>Well. For me there are two reasons:
>
>1.) It's free, for Fiffi you have to pay
>2.) It works with MiNT-Net and N.AES (Fiffi works neither without IConnect
>nor with MiNT)

1.)Fiffi is bundled with CAB 2.7 and 2.8, so in practice one doesn't have
to pay for it.
2.)That's true, but I can say the same thing about Aftp... the fact that a
client only runs under stack A or B, doesnt say anything about the quality
and functionality of that client.

>>give up the advantages of using Scripter while doing internet stuff.
>
>There's no need to give up good behaviour. :->

You've actually managed to surprise me, see one of the other posts...

Hi Frank,

>Well. I am using CAT and apart from that fact that it is free as well it
>sorts Mails (at the moment I have ~10.000 mails just only in
>comp.sys.atari.st) in a fraction of a second. The database is approx. 50
>Mb.

Sit back and grasp something solid:
This may come as a shock but when I'm wrong, I have no problems admitting it, and as far as CAT is concerned. I'm wrong...
I'm wrong because I didn't follow the development of this app closely enough, it used to be a Maus net reader/poster, and as such of little use to anyone except for people living in Germany & Austria. I have some of the first versions here. Last night however I took a peek, and to my amazement noticed that this app has evolved into a full blown mail/news client. A quick glance in the docs revealed that it runs on any stack you care to throw at it, even IConnect, and under certain emulators an available DSL connection can be used.....
So, it's not easy to say something negative about this app, I haven't had the chance yet to test it in practice, but given the number of years it's around and the version number I don't really expect problems in that area also.

>Any questions? :-)

YES!!!!
So why is this such a well kept secret? I at least knew something about CAT but I'm convinced that many people here have never heard of it before. If you ask me this app *deserves* an English translation ASAP, and if Pascal Richard is reading this a French version will no doubt follow suit. I'll get in touch with the author privately and if he agrees to it....

So tell me Frank, how many more of those little jewels are you guys hiding in those large German sleeves? ;-)

Cheers from Belgium

Hi Janez,

>> I really would love to find out what makes aFTP so special that I can
>> trash Fiffi tomorrow.
>
>I can speak for me> main reason i use it, thats perfect avserver client,
>so aFTP window behave exactly the same as normal desktop window, so
>dclicking a *.lzh will invoke installed LZH archiver, dragging to local
>folders etc will copy/move/rename file. Also its hotlist can be exported to
>Thing group file, so clicking on Start button>url opens window with that
>FTP directly etc.. So it has its share of usefull options.. And on end, it
>dont look like 99.9 perceont of other FTP apps on XXX platforms, with dual
>windows for remote and home dirs etc..

OK, but you haven't given me one reason why I can trash Fiffi and use Aftp
instead. All the stuff you mention can be done with Fiffi also, and it has a
couple of addional tricks up its sleeve as well. I get the impression that
you never ever seen Fiffi in action and because of this have no clue what it
can do or even what it looks like... if you would have ever seen it then
surely you would know that it just like Aftp uses only one window also?
So the figure is down now to 99.8 percent :-)

I used to be a Aftp user once also, but the day when Fiffi 1.0 was released
I replaced it and never looked back again. All the stuff you've mentioned
was implemented much later in Aftp....
Hell, it didn't even had a resume download/upload option back then!
From where I am sitting it looks like Fiffi was the shining example and
source of inspiration for the Aftp programmer. The only difference is the
hotlist, Aftp exports the links to the Things groups, while Fiffi uses the
DHST protocol for this (StartMeUp). IMO Fiffi took the best route, how do
you manage that hotlist if you are not a Thing user?
Fiffi in addition is also a Scripter client, and that makes a hell of a
difference as well, anyone who has to frequently update his website will
love it, one simple mouse click....
Fiffi was bundled with CAB 2.7 and CAB 2.8, so the argument that one has to
pay for it is not really true either. Every CAB user has it...

Cheers from Belgium

From: "Cyril Lefebvre" <cs.lefebvre@free.fr>
Date: Thu, 6 May 2004 14:40:32 +0000 (UTC)

Hi Cyril,

>but an access to Iconnect client is not possible. My provider is Free
>telecom, in France.

Hohoho... hold on. It might be that we misunderstand each other, but from what you wrote I conclude that you can make a connection with Iconnect? if not you couldn't report the connection speed. If you can connect but not use any clients then the path to the ETC folder is incorrect... Start up Iconfig and select the correct path. I know this sounds silly, but over the years in my experience that incorrect path was usally the reason why most people didn't succeed. If I understood it all wrong, then mail me privately in French, I understand your local lingo...
Oh yes: the ETC folder is located in the PPP folder, but you can place it anywhere you like, just make sure that Iconnect finds it...

>Note : With Iconnect AND Magxnet : it's the same problem. Why ?

Same reason as given above: if the ETC path is not correct, none of the clients will work... Also note that with Magxnet you shouldn't use Iconfig.prg and IConnect.prg, although it doesn't use these two apps, it uses the ETC folder, CON_INFO also works under Magxnet (see below)....

>With Iconnect, I try to modify the MTU configuration, but no result...

Stay away from the MTU configuration dialog, MTU speed is set when the connection is made automatically, it's only there for the sake of people using the SLIP protocol. Same thing for the DNS numbers, leave them blank, just like MTU speed they are set automatically also.

Assuming that the ETC path is set correct, then turn your attention to connection specific stuff, first of all check that you use version 1.8, if you use an older version, get the update from the ASH website. When you start up Iconnect check that RSDEAMON and IDPSERV are running also. these two apps normally are started up autmatically by IConnect, if they don't run, create a START folder inside the PPP folder and put the two apps in there.
Once that Iconnect is running startup CON_INFO, this little app IMO is the most important one of the package. It'll show you at what speed you are connected, show the temporary assigned DNS number, and also the IP numbers of the services -- POP, SMTP, USENET and TIME servers -- if there are no numbers to be seen, then we know for sure that Iconnect failed to resolve them... if there are numbers however then turn your attention to that ETC folder again...

Assuming that there are no DNS numbers for the various services then you have a resolve problem and its time to start up IConfig. Activate PRO mode and go to "DNS", make sure that the DNS number is 0.0.0.0, and change the initial waitstate value from 1 to 5 seconds. Next go to the 'PPP" entry and change the first timeout value to 750, at the bottom of the dialog there's an LCP-echo-interval box, enter the value 2 in there.
Go to "TCP" and change the values for transmission and connection timeout to 90 seconds. Deactivate "Allow precedence raise"
Go to "IP" and change incoming que timeout to 60, and if you like to live dangerously put a value of 1 into "precedence" :-)

And that's about it... but I don't think it'll be necessary to go through all that trouble. If for some reason it would still not work, then mail over your configuration file.... two pair of eyes usally see more then just one.

If it's any comfort: I know a guy in France who use IConnect and he has the same ISP as you have. So whatever it is that's causing this it can't be a major problem.

Cheers from Belgium
Dennis

From: Frank_Szymanski@du3.ohse.de (Frank Szymanski)
Date: Thu, 6 May 2004 17:15:50 -0000

Hi Frank,

>I had Emailer running under MiNT with IConnect so it seems that
>Emailer doesn't need MagiC. :-)

Emailer doesn't need MagiC, but it does need IConnect. If you were able to
run IConnect under MiNT it must have been an older version because from
version 1.7 onwards MagiC multithreading is used by IConnect...

>And yes, you are right. There is no need for IConnect clients. There are
>better alternatives for MiNT/MagiC-Net.

Once again I disagree.... ;-)
You comment on Iconnect clients running under an old outdated stack, it's
the multithreading capabilities that make Iconnect 1.7 and 1.8 so special.
The very first thing that is obvious is that there are no more wait states,
the programmer went through great lenghts (6 months of his life) to ensure
that Iconnect would in all circumstances provide the fastest and most stable
connection of all Atari stacks (including MintNET). It's not the Iconnect
clients that makes the whole lot exceptional, it's Iconnect itself.
There aren't many IConnect clients out there except for these from ASH, but
one that runs under Iconnect is aMail. One must really be blind not to see
the differences immediately... the POP and SMTP servers are accessed with
the blink of an eye...
I have a Mac also... why do you think I still use Atari clients to access
internet? When downloading posts from USENET for example, there's nothing
out there that beats ASH EMailer in combination with IConnect. And on a
dialup connection it's even more obvious... run the five Iconnect clients
all at once and observe: no drop in speed at all. It's not the clients that
are so brilliant, it's the way that IConnect was constructed. Although
coming to think of it, the last update from the clients is almost 4 years
ago, not bad in my book.... after 4 years most of the stuff out there is
still playing catch up.

>But it might be interesting to use IConnect clients just for the fun of
>doing so. :-)

You'll have a change of heart very soon....
Drop Vassilis a mail and ask him for the IConnect gateway beta. Next run CAT
and be amazed.... and before you know it you'll be a "believer" also. After
all there's nothing that can beat a real test, is there? While you're at
it, install ASH Scripter also. There are a couple of amazing IConnect client
scripts on the DDP website (see sig). Instead of having just fun you'll

actually enjoy it. And that's what makes computing with Atari's exceptional,
but you need to use the best suited stuff of course. <fat grin>

Cheers from Belgium
Dennis

Source record: 18829

From: Janez Valant <swe@atari.org>
Date: Thu, 06 May 2004 18:08:57 +0100

Hi Janez,

>I agree on that, but there is another problem, its not meant as
>provocation: how to use Magic objects etc in some new AES, if Magic
>AES code is protected and source not released? Is there a detailed
>explanation of those objects, how to implement them on AES level.
>Programer's guide (for AES not client apps) or something like that?

As a matter of fact yes... Andreas Kromke provided detailed info about
this issue. Peter translated almost 95% of the programmer docs, and I
took care of the remaining bits and pieces. They could be downloaded
once from Bengy's MagiC Online website. I have no idea however where to
find them now.... If you want them, I'll turn the house upside down, but
Peter might have a copy somewhere at hand?

>Same or course N.AES but i don't think N.AES introduced own objects
>etc...

I haven't got the faintest clue....
Some years ago I contacted Woller about translating the whole shboom,
but he didn't even bother to reply, so as far as I am concerned...

>Common Dennis, stop that.. "NAES is crap, look how Texel icons look
>shitty" and so on, is not that we blame u to like nice look, we blame
>u on calling some application a crap, not to mention what many coders
>were called, due to mainly cosmetic problems..

I've told you once that I call a horse a horse....
If something IMO is crap then that's exactly what I'll say, if you
blame me for that, then you blame me for having and *expressing* an
opinion. Where is it written that I should like and love the same
things as you?
BTW: the last app I've called crap was Newsie, you can stand on your
head and explode for all I care, but that piece of shit has more then
a cosmetic problem.
And coming to think of it, the icons do look shitty! And why they look
shitty is not really the user his concern. N.AES was developed long after
all these apps with their "pretty" icons. The developers of N.AES should
have made sure that stuff like CAB and Texel, didn't look shitty at all.
Suppose that the author of MyAES delivers the perfect AES but that *every*
existing app look shitty under it, you know just as well as I do that
MyAES will be blamed for it and not the apps.

>And then we may go on in some constructive debate. I can talk for
>myself, and prolly for many others, that u never was blamed cause u
>like the look, but how u rate apps u hate, where suddenly look (since
>no other functionality was missing) was the most important stuff...

A constructive debate? LOL
There was a time once that this was possible in CSAST, the times
however have changed. *ANYONE* who dares to express an opinion that
goes against the mainstream will find it out soon enough himself. Over
the years I've been involved in many heated debates here, some of these
debates ended in OS-wars but at least we were debating and discussing
something and no matter how ugly a thread turned into, there was
almost always something to learn or informative to be found in them.
These times are history, now the man is tackled instead of the ball,
one does't look at the topic anymore, but react to who posts...
Take this post for example, except for the first paragraph it's off
topic, once again I have to stand on a soapbox and defend myself for
having an opinion. You may not like the word CRAP, but it's a valid
English word. Your gang has managed to scare anyone of airing his opinion
in here, unfortunately for you that doesn't work for me... none of you
will prevent me of airing my opinion.
In the post I wrote about NVDI 5.xx and some of it functions that have
never been seriously exploited, I gave a couple of examples of apps and
utils that have scratched the surface , but all that went unnoticed. You
fell over the words "pretty looking"... that's a nice example of how the
man is tackled instead of the ball. Your gang doesn't read anymore what's
written, you just look at who posts, and then go searching for something
to pull out of its context.
It's an interesting topic, this thread could evolve in a very informative
one, but it's up to you of course. We either discuss & debate the ideal
AES or we can turn it yet again into an ugly thread. And when all is said
and done you guys can smile all the way and say that I started it...
Or have you perhaps forgotten what an informative thread is all about?
After wading my way through shit like is Aranym an emulator or a virtual
machine I sometime wonder what the hell we're busy with...

>I can talk for myself, and prolly for many others,
>that u never was blamed cause u like the look, but how u rate apps u
>hate, where suddenly look (since no other functionality was missing) was
>the most important stuff...

Oh boy!
Hate? Do you think I *hate* apps? I'm a very peaceful person, I don't even
hate people....
I don't like TTP stuff, and if I can avoid it I will not touch it. As far
as I am concerned these belong in a museum. In 2004 these monsters should
not exist anymore. So when someone here proudly announces a new ported app
or utility, with no GUI... yep, I climb on my soapbox. The argument that
from TOS 1.0 onwards TTP's were supported by Atari is bullshit, I can't
remember Atari ever releasing a TTP, can you? I did not buy a Atari to be
confronted with that ancient stuff, UNIX and DOS users may love it, but I
don't have to love it at all. Linux after all these years is breaking more

or less through, ever wondered why? I presume its purely coincidence that CLI's are being replaced with GUI based stuff? It's crystal clear to me: people like GUI based stuff, anthing else is not appreciated anymore. Sure there are some "hardliners" out there that won't touch anything else, but they are a very very small minority.

But this is about much more then looking pretty, it's about how a user interacts with an app. I don't doubt for a minute that some TTP based apps have more functionality, but there's no way I'll go looking for that functionality. I'm not asking for an app with an overwhelming GUI, loaded with pretty looking icons, something quite simple is good enough... and yep, I know you think differently about this, but I have the right to like and dislike also. And it's about time you start respecting those rights. There's a mouse connected to my keyboard, I want to use use it... I've had my fair share of using apps without a GUI, those days however are long gone, and moving foreward IMO certainly doesn't include TTP's.

>I don't like N.AES cause it look great, i love it because
>N.AES/Thing/Taskbar/F1 combo offers a lot of small things (like
>dclicking arrows, use left/right mouse button on arrow to reverse
>scroll, great drag'n'drop via F1 or taskbar...) which really make
>life a lot easier. Didn't notice those things on windows/macos which
>i use a little or Linux/KDE which i use a lot.

Sure, and that's exactly what I wrote: compared to our desktops the other platforms have a lot catching up to do. I think that the desktop is about the only thing where Atari still shines. Unfortunately however a lot of users don't use it like it's intented, when ever I mention Jinnee in here, someone comes forward reminding me how nice it looks and how much it resembles the Mac desktop....well, ny desktop doesn't look pretty, and as far as resembling a Mac desktop goes, that is not possible. I can do a hundred things more from within Jinnee then from a standard Mac desktop, and the same goes for XP and KDE stuff.

>>Its the feeling before look, otherewise id prolly stuck in MacOS.

I don't think so, I can't imagine an Atari user going wild about MacOS, XP or Linux desktops at all. To get more or less the same functionality from the MacOS desktop as we've got you'll have to install a truckload full of additional utilies. IMO the problem is that a lot of us simply have no clue what can be achieved. If I for example write that Jinnee needs Scripter because it's Scripter that makes it outstanding, I'm convinced that a lot of people here don't even know what Scripter is. It's difficult to explain also, without seeing it in action. And that's the main problem with this platform. No more user groups, magazines, clubs, shows etc, its at those events that people used to learn and see new stuff... You just wrote about F1, well.... I'm afraid that I haven't got the faintest clue what that is :-/

In a different thread I just admitted that CAT has indeed evolved into something nice. I'm not an encyclopeadia on two legs! Like most of us I depend on information, if someone develops a nice utility & app, but fails

somehow to make it known to the whole community...

Cheers from Belgium
Dennis

Thanks,
Mark

3144. GIM get Vector Fonts

Newsgroup: comp.sys.atari.st
Date: 2004-05-11 21:57:38 UTC
From: Mark D <mducksub@removenoaspam.atari-source.com>
Message-ID: <pan.2004.05.11.21.57.37.726303@removenoaspam.atari-source.com>
Source record: 18825

Hey guys,

If you are curious, head over to
http://gim.atari-source.com/screenshots.php and check out the top
screenshot. It illustrates that in CVS now there is preliminary support
for proportional fonts in conversations. It still needs worked on, right
now it only draws incoming IM's not outgoing or system messages but the
hard work is done. Especially compare the top screenshot to the next one
down and note the font qualities. I think proportional fonts like
Bitstream Vera (which is free incidentally) rock!

I have decided to retain the code and to do tests on config changes to
determine whether or not the selected font is proportional, this way on
slower systems, you can regain some raw speed by using a monospaced font.

In addition I am working on configuration dialogs and stuff to
automatically create config file or buddylist if they don't exist. Also
going to make it automatically update your saved buddylist when you add a
buddy through GIM.

Also looking into proper unicode support which seems tough but not too
bad. Don't know how well GEM/Windom supports it, but I have noticed there
are many separate functions to handle 16 bit strings. I know japanese is
represented with UTF8 which I am not sure it that means 8 bit unicode or
not. I have some research to do on internationalization support.

PS: If anyone finds my posts to be getting a bit too numerous about GIM,
please let me know and I'll slow the pace on the posts.

Thanks,
Mark

3145. Finally got my TT:-)

On a Falcon yes, there's an IDE bus inside. Other machines need an adaptor plus TOS 2.06 IIRC.

Dennis Vermeire wrote on Tue 11-05-2004 23:37 (+0200):

> So why is this such a well kept secret? I at least knew something about CAT

I think this is not well known because it's not been a very long time
it's an Internet client, but you may have missed some of the
announcements here for some months (at least).

Okami used to be a Mausnet reader/writer too, before becoming an
Internet client as well, but it was rather long ago (I use it for at
least 6 years).

No, not at all - at least on mine.

> Do not forget to change the fuse, to one of about half the current.

Mine is a 250V / 2A Fast... so it should be 4A Fast for 110V...

No, the current doesn't change, the voltage does.

>pretty much screwed.. cause to make it work at 220, i need to change the
>transformer, to deliver 12V 0.2A and 5V 7A from 220V.
>Well... meanwhile, i'll use an external converter ...

I don't know what you mean by 'converter', but a small external
100 VA or 125 VA 220:110V auto-transformer should be quite small
and relatively cheap.

I would be a little vary of the suggested series lamp solution -
when cold the resistance of a lamp is very low and the surge could
blow the existing 110V transformer or other electronic parts.

Regards, /Peter/

Not so. To get the same amount of power at half the voltage you need twice
the current.
Refer to Ohms law.

Coda.

Sorry, I'm not speaking of the cd drive but rather the cd itself.

But it could be that the drive is bad.

For the longest time I had problems with 2 drives. Got a third newer drive and
it works perfectly fine now.

So if you can, get hold of another cd drive and try it

Hi!

I read all the post about the subject!

Is-there a a link to find the soft!

About the color, just keep in mind that
the rï¿œsolution of the master must be + or >
of the slave screen!

Another point is the X11 support, maybe
you need special x11 With 256 colors !
To do test, don't forget you can use several X11
with you computer !

Bye!

jpguinospam@noos.fr
just remove nospam for mail:)

3162. TRY THIS!! IT WORKS!! MONEY$$$ NOW!!

TRY THIS!! IT WORKS!! MONEY $$$ NOW!I COULD NOT BELIEVE IT!! I ACTUALLY RECEIVED MONEY! Here are the 3 easy steps to success: STEP ONE: Get 6 separate piece of paper and write your name and address plus the following on each piece of paper "PLEASE PUT ME ON YOUR MAILING LIST." Now get 12 US$ and place TWO inside EACH of the 6 pieces of paper so the $2.00 will not be seen through the envelope (to prevent thievery). Next, place one paper in each of the envelopes and seal them. You would now have 6 sealed envelopes, each with a piece of paper stating the above phrase, your name and address, and $2.00. What you are doing is creating a service and you are paying for it! Like most of us I was skeptical and a little worried about the legal aspects of it all. So I checked it out with the U.S. Post Office 1-800-725-2161 and they confirmed that it was indeed legal. Mail the 6 envelopes to the following adresses: 1. MANUEL TINAJERO/542 HERNANDEZ/ LAREDO/TEXAS/ 78046/ U.S.A 2. R.C FAULK/ 7509 NE VAN MALL DR. C-13/ VANCOUVER/ WASHINGTON/ 98662/ U.S.A 3. ZACK LONGLEY/7686 CALLAGHAN RD. APPT 3304/SAN ANTONIO/ TEXAS/78229/U.S.A. 4. MAURICIO LIMA/ 4221 AGUSTIN MUNOZ MONTEVIDEO/11900/URUGUAY 5. E. SIMON/ 1849 SEDGWICK AVE/ BRONX/ NY/10453/ U.S.A 6. B. CURRY/ 14923 JERPOINT/ ABBY DR./ CHARLOTTE/ NORTH CAROLINA/28273 STEP TWO: Now take the #1 name off the list that you see above, move the other names up 6 becomes 5, 5 becomes 4, etc., and Add YOUR NAME as number 6 on the list. STEP THREE: Change anything you need to, but try to keep this article as close to the original as possible. Now, post this amended article to at least 100 newsgroups. (There are close to 450,000 groups on Yahoo Groups alone). All you need is 100, but remember, the more you post, the more money YOU make! You won't get very much unless you post like crazy! This is perfectly legal! If you have any doubts, refer to Title 18 Sec. 1302 & 1341 of the Internatational Postal Lottery Act. Keep a copy of these steps for yourself and, whenever you need money, you can use it again, and again. PLEASE REMEMBER that this program remains successful because of the honesty and integrity of the participants and by their carefully adhering to the directions. Look at it this way. If you are of integrity, the program will continue and the money that so many others have received will come your way. NOTE: You may want to retain every name and address sent to you, either on a computer or hard copy and keeps the notes people send you. This VERIFIES that you are truly providing a service. (Also, it might be a good idea to wrap the $1 dollar bills in dark paper to reduce the risk of mail theft.) So, as each post is downloaded and directions carefully followed, six members will be reimbursed for their participation as a List Developer with two dollars each. Your name will move up the list geometrically so that when your name reaches the #1 position you will be receiving tens of thousands of dollars in CASH!!! What an

opportunity for only $12.00 ($2.00 for each of the six listed above) Send it now, add your name to the list and your`re in business! NOTE: Send only US dollars in this program as the US dollar always has a stable exchange rate and is easily available to peoples outside the U.S. If you live outside the U.S. then please exchange local currency int 12 US$. Exchanging money int $ is cheap, easy and can be done at most banks, post offices, embassies even super markets. It will all be worth it when you start receiving thousands of dollars in the mail. Also letters to places other than your own country, it is a good idea to send them airmail not by land, there is not a lot of difference in price for this. POSTING TO NEWSGROUPS********** STEP ONE: You do not need to type this entire letter to do your own posting. Simply put your cursor at the beginning of this letter, drag your cursor to the bottom of this document, and select `copy` from the edit menu. Open a blank `notepad fill

> on SAVE AS in the dropdown menu. Save your article as a text file in your
C:
> or A: drive.
>
> E) If you still have all of your text, send or post to this newsgroup now
by
> just cliking the SEND button (just below the File dropdown menu and above
> the Cc: button.
>
> F) Here's where you are going to post to 250 ore more, newsgroups... OK...
> click on any newsgroup then click on "TO NEWS"... again. In the top left
> corner of your screen. Leave the newsgroups box alone again, put a flashy
> subject title, hit tab once and your in the body of the message. Now,
click
> on the attachment file... now find the file that you just saved in the
> previous procedure. Click ONCE on the file and click OPEN and then OK. If
> you did this correctly, you should now see your file name in the
Attachments
> Box and it will be highlighted.
>
> G) That's it!!! Each time you do this, all you have to do is type a
> different newsgroup so you can post this message to 250 or more DIFFERENT
> NEWSGROUPS. I know, I know, you still have 249 to go, but it only takes
> about 30 seconds each, once you get the hang of it.
>
> Here it's a Write 3.0 format file [usenet.wri] with at least 1,600
> newsgroups addresses:

Do you know how much work it will require to port it to AES/VDI? VNC is
basically just a lot of blitting, right?

Hi Mark,

MB>Also a source for ram upgrades would be helpful, only 2MB ST ram in my
MB>new machine.
your remark makes me suppose that there is no RAM card at all in your
TT, neither TT RAM nor ST RAM.

You will need an extension card for both types of RAM. My TT came with
4 MB for each type. I replaced the 2MB card with a 10 MB one and
replaced the 4MB on the TT RAM card with 32MB. And the RAM has been
stable so far (since '95).

Now I long for a 64MB solution when a friend will finally swing over
to the Mac and give away his TT, for you'll never have enough RAM.

Sorry, if I'm not wrong (please prove me to be wrong!) the second hand
market will be your only chance.

Good luck!

Und TTschï¿½
ps

>Emailer doesn't need MagiC, but it does need IConnect. If you were able
>to run IConnect under MiNT it must have been an older version because from
>version 1.7 onwards MagiC multithreading is used by IConnect...

Ah. That's the reason why IConnect refused to work on MiNT a few years ago
after I installed a newer version of it.
Anyway, I took the chance to completely switch to MiNT-Net and I do not
regret it.

>>better alternatives for MiNT/MagiC-Net.
>Once again I disagree.... ;-)

;-)

>You comment on Iconnect clients running under an old outdated stack,
>it's the multithreading capabilities that make Iconnect 1.7 and 1.8 so
>special.

Ah, now I understand. Due to the fact that I am using MiNT (although I have
MagiC I do not use it for several reasons) there is no advantage for me, just
the opposite. As you stated above now its impossible for me to use IConnect.
Well, my setup is running well under MiNT-Net so there is no need for me to
switch stacks. :-)

>that Iconnect would in all circumstances provide the fastest and most
>stable connection of all Atari stacks (including MintNET).

I don't know anything about the download rate of IConnect but I achive ~7500
Byte/sec with MiNT-Net and CAB.

>I have a Mac also... why do you think I still use Atari clients to
>access internet?

;-)

>dialup connection it's even more obvious... run the five Iconnect
>clients all at once and observe: no drop in speed at all.

Same here with MiNT-Net.

>>But it might be interesting to use IConnect clients just for the fun of
>>doing so. :-)
>You'll have a change of heart very soon....
>Drop Vassilis a mail and ask him for the IConnect gateway beta. Next run

Well, I am not in a hurry... :-O

>CAT and be amazed....

For CAT it isn't necessary I think (it only takes a few seconds to get my email and for news I am still posting from within the MausNet). :-)

>it, install ASH Scripter also.

First I have to buy it. :-)

And perhaps there is still work to do, I mean, it's a fine newsreader/email program but for example there is full unicode support missing (and I have never heard about an email client on the ATARI that handles unicode mails).

Thanks god CAT is OpenSource so any developer is invited to help. :-)

Dimitri Junker (who is the main developer) is always looking for helping hands, no matter whether for writing manuals, testing or programming. :-)

>to explain also, without seeing it in action. And that's the main
>problem with this platform. No more user groups, magazines, clubs, shows etc,
>its at those events that people used to learn and see new stuff...

Hey, Dennis, don't be so pessimistic. At the moment I see a lot of progress
on our plattform (compared to the end of last century).

There is new hardware (CT60, Eiffel, EtherNEC, perhaps SuperVidel) and at the
software side there is a lot of development from people worldwide

You can read DVD-ROMs with Anodyne's ExtenDOS, we have Highwire as an
alternative to CAB, GIM just hit the scene, Papyrus X! was even released for
our small platform, everyone has noticed ACE Tracker etc. etc.

Oh, not to forget Apache and Samba, so you can use your beloved ATARI as a
server (if you are not completely addicted to MagiC).

I can say that I am quite satisfied at the moment.

Regards,

Frank

I've heard from others that they have been disappointed about the heat of discussions you can sometimes find here.

>>1.) It's free, for Fiffi you have to pay
>>2.) It works with MiNT-Net and N.AES (Fiffi works neither without
>>IConnect nor with MiNT)

>1.)Fiffi is bundled with CAB 2.7 and 2.8, so in practice one doesn't
>have to pay for it.

I didn't know that but that might be because I am still using CAB 2.5. :-)

>2.)That's true, but I can say the same thing about Aftp... the fact that
>a client only runs under stack A or B, doesnt say anything about the
>quality and functionality of that client.

Of course it does not. But for me Fiffi is worthless because I do not have MagiC installed.

From what I saw, it will require next to no work. VNC is designed to be
extremely easy to port to different video systems. Yeah, it's pretty
much JUST blitting. It needs routines to open a window, scrollers and
bitmap copying. You can even use built in scrollers!

Thanks,
Mark

I undestand perfectly this point!
I just suspect the X11 serveur linux for the color rï¿œsolution!

Another point maybe usefull for you, it is a
master&slave soft for both atari&linux for remote
keyboard atari on network:)

I can

OK, so you could use a longer (not too long!) IDE cable with another plug for the CD ROM. Adaptors are also available for adapting 2.5 to 3.5 - of course the CD ROM will have to sit outside the Falcon case unless you recase it.

Why should you try Bravo Sierra Computers? Maybe you should ask Why Not? Those telling you Not to buy have there own prejudice to deal with. I can only speak for myself. Why Buy from BSC? Good Service! I earn your Atari Business one Customer at a time! Many Customers refer me to friends. Good Support! I'm in this for the long haul. Should you need Atari Help, I held teaching positions in my local Atari Clubs. You can call me or I'll call you for Atari Phone Support. I'm a good teacher, and I dont speak over my students heads! I prefer to keep it simple when necessary. Atari Sales! I have a lot of Atari I can sell you! Games/ Software, Hardware, Books and Accessories.Rather than print up a Catalog, thereby making it out of Date! I regularly update my Catalogs, for you to Download or view online at:

http://BensCatalogs.Atari.org

http://www.aracnet.com/~atari/atariclub.htm Portland Atari Club.
http://www.aracnet.com/~atari/newstuff.htm Whats New from BSC.
http://www.aracnet.com/~atari/shipping.htm Shipping Tricks I can do!
http://www.aracnet.com/~atari/specials.htm Atari Tax Break Special!!
http://www.aracnet.com/~atari/whybuyben.htm Ben's Living References!

I've got a fast turnaround rate. Usually, Once I receive payment your order goes out the same day. Customers love the speedy service! I have lots of Atari SoftWare & Books. Which I can send by Media Mail Rate!

Please Direct all Replies Through E-Mail to: BenSells@Atari.org or Atari@aracnet.com. If you can't reach me, see my info at the Bottom!

Atari Jaguar, 8 Bit and ST Games/Software, Hardware/Accessories & References/ Books. FREE Catalogs on Ben's Domain at http://BensCatalogs.Atari.org or at http://BenSells.Atari.org Catalogs can be attached to,Requested by & Received Through E-Mail at Atari@aracnet.com or BenSells@Atari.org and Please Specify Atari 8 Bit, ST, Jaguar and/or all 3! Or Call Ben anytime at (503)256-9974!!!

What are you talking about? Alot of games run better on the TT than
they do on the Falcon.
Elite2 was beautiful on my TT, Civilization ran without the problems that
the Falcon had, Their
Finest Hour flew like a bird. Pirates ran perfectly. I only encountered a
small list of games that didn't run, and most of them were games I didn't
care for that much anyway. If you are trying to run 'menu disk' versions,
that is probably your problem.

Who the heck cares if ST games work? ST's are dime a dozen.. Just buy
one if you want to play games, buy a TT for the low cost /|\ horsepower,
good ram upgrades, and excellent vme expandability. That makes sense ;-)

>

The majority of games that I found that would not run on the TT, would
not
run on anything other than TOS 1.0. So if it had problems on a Mega ST or
a MegaSTe, it probably wouldn't run on the TT. But the same is true to a
greater
degree for the Falcon. Backwards helped the Falcon run a few more games.
There
was a similar program for the TT, but I can't remember what it is called at
the moment.
Was never a big concern for me.

In general you can say anything made by a major US game house
(Microprose, Sierra,
Lucas Arts) and released after 89 or so, would work on the TT. There were
some
Microprose games that were licenses of smaller houses, I won't guarantee
those in my list.
The simirils adventure games worked as well. And the original Atari label
games like moon patrol ran fine on the TT. This is just off the top of my
head from memory.
The number of games that I cared to play that didn't run on my TT were few.
So basically
I forgot the games that didn't run.

> Yes Menu disk games will not run, single filed or HD installed games are

>

There were very few specific TT games. There were a couple out there,
but I don't remember
what they were right off the top of my head. This had alot to do with the
price and availability of
the TT made it a rare beast until shortly before the Falcon was released.
There was "Ancient Art of War in the Skies" which listed the TT on it's side
panel. I bought a copy just for that. I don't know if there were other
games that listed the TT on the box from the big houses.

However if you look at shareware, small house commercial software, the
numer of TT games rises dramatically. OXYD had a version for the Falcon &
TT, same binary same graphics. GEM Nethack was originally written for the
TT's Medium resolution. Premium Mahjongg had support for the TT
resolutions, Valency did as well. Then there were alot of games like

Astropanic94 & World Conquest that ran happily in the TT's resolutions. If you are looking at shareware/freeware games that run on the TT, pop on over to GemCandy I have 135 different programs listed at the moment, and a majority of them should run on the TT with no complaints.

The problem games were generally action games, where the programmers did tricky things with the hardware or games that were written with a rotten compiler or bindings.

Well i have Falcon mb in MegaSTE case. It didn't need much modifying
at all.

>work. ;-))

Yes. I totally agree. Even though it is just a version 0.1.7 I am using it now more often than CAB. The current cvs-version even allows to google. :-)

Of course there is a lot of functionality still missing (like SSL or downloads) but I would dare say that it is nevertheless a useable piece of software, fast, rock solid and it even supports Unicode. :-)

You should contact Dimitri about that. As of today CAT already supports
Unicode but only in a very simple way. You can export such mails as .html and
view them with either Highwire or Papyrus. :-)

at
> the moment.
> Was never a big concern for me.

I have found quite a lot of my games run on my MegaSTe, though I don't use
it for that, but for MIDI work. I have a Stacy too, which I also use for
MIDI, but its great with my Philips 8833II monitor and with a joystick
plugged in too, I played Wizball for hours (days) on it.
I don't bother with games on the Falcon. Tried Backwards, runs some stuff
OK, but not a high percentage, I didnt waste any more time trying to get
games to work, I just dusted off the 1040STFM (Tos 1.2) for hassle free
gaming.

Just wondering if anyone reading CSAST uses a Atari Falcon or other ST
for graphics and Video.
Either as a Hobby or for Real Work?

If so, I'd like to hear more about what type of stuff you are doing and
the software your using.

Also, Aren't there any Atari groups devoted to different areas of the
Falcon or other Ataris
for Graphics/Video/Animation and Music, MIDI, Sampling also
programing, and DTP, WP and etc.???

If not I wonder if there are enough Atari Users left to create some
specific Groups with these types
of interests?

Bruce,

I have 2 TT's. One is for sale. Specifically I have 1 that I received from Boris Cahan which (author of TelVT102) which works perfectly 100% that I'd like to keep (forever), and I have another one which was Noah Silva's and it has some serious issues. Aside from being all mangled due to being recased, the power supply was a bit wonky, so I put a new one in from my stockpile of them and the power to the keyboard is still funky. The video also somehow got friend (he told me he did it by accident one day). Anyway, the video could possibly be fixed via the use of the AlberTT video card I would include with it for free, but this card kinda sucks TBH. This thing used to have a CaTTamaran too so I think that's a big part of the problems. I plan to at some point start chip swapping with my other TT until I narrow the problem areas and order replacements so I could repair it to proper working order. TT's are nice because they actually run freemint with some sort of reasonable speed, and they run MagiC from a normal desktop user perspective fantastically. With the Nova Mach 64 video card I have it's quite a machine. Anyway, do you want it? If either of you do, I could resume my repair efforts, because I need to dump one of them.. I don't need 2 of any atari machines. In fact I want my collection to end up, 1 mega ste, 1 tt and 1 ct60 falcon.

Thanks,
Mark

Not as much as I once did...life, age, priorities....
Lack of ST time isn't so much a result of market changes as it is life changes, and time avilable for such fun stuff.

> If so, I'd like to hear more about what type of stuff you are doing and
> the software your using.

When I do...these are the kinds of things I still use my Atari systems for. Some, on a regular basis, some...when time and energy allows.

With all my Ataris, unless I'm running Legacy apps or MIDI utilities, I usually run
NVDI 5 with MagiC 6.01 or MiNT/N.AES.

A few things, I use Geneva/NeoDesk for. (Makes a really good CueBase setup).

1. I put a nice SCSI flatbed scanner on my Falcon years ago. I use this in conjunction with Photoline to scan, render, and print photos. I often want or need to move this over to the windows environment for various reasons...and it's no problem since my Falcon is on an enthernet LAN, and also has a Zip drive. The scanner isn't even officially supported by its maker any longer...so as windows moves on...drivers for it do not. So...its home will stay with the Falcon till the day it dies...and why buy a new one for the PeeCee when this old one really does a better job anyway ;)

I also have the True Image/True Paint package, and PixArt installed on the Falcon. They don't get as much use as Photoline; however, there are a few neat and unique things about each package keeping them all worthy of the hard disk space.

When it comes to artsy stuff, like making my own graphics for a web page, or clip art for a news letter, etc....I tend to stick with the Falcon CT2 rather than using the PeeCee...simply because all of my templates, libraries, and foundational work has already been laid on this platform. Years of work...and learning the ins and outs of the software....like a favorite pair of sneakers! Sometimes it's even fun to add to my library of 3D objects using povray. A bit of 3D can really spice up a web page or letter head ;)

Finally on the graphics end...
As a music teacher, I often need scores and musical parts! I haul a STacy to work every day, and this STacy has CueBase Score, and Notator on it. It also

has Page Stream and Atari Works. Quite often I need 'snippits' of music for a complex printed test lay out. In these cases I'll build my musical notation with CueBase or Notator then print it to the hard disk as an img file. From there, I can import it into Page Stream, and easily build my test around it.

I tend to avoid 'printing' at high resolutions with the STacy, simply because it can take half an hour to print a dense page of text or music at 300+ dpi, even using TOS patches such as OutBurst that cut printing time in half! For these kind of tasks, I basically use the STacy as a sketch pad and cache up my printing jobs till next time I'm at the Falcon, or a fast PC running an Atari emulator. I can easily put the STacy on the ethernet (ENEC), or use a null modem cable, floppies, or a Zip drive to transfer the work-files of such projects. Of course, sometimes it's just as easy to print from the STacy and let it take all day ;) What's my deadline? That determines when and how I'll print.

2. General Office....
I use Atari Works quite often on my STacy....It's got just the right tools for my simple needs. A basic word processor that can import and export RTF files, a Data Base that more than fits my needs, and a spreadsheet that's quite adequate for the few spreadsheets I build. Really, the only thing AW lacks that leaves me pouting at times is color printing. Oh well, that's what Page Stream is for :)

I do keep a copy of Word Writer 2 on hand when I need a quick and dirty print out. Since AW uses GDOS...and that prints slow as molassas on an ST/STacy with limited memory....I find it's a good idea to keep WW at hand in the event I need a very quick and high quality letter or memo printed out on a ready made letter-head. WW2 doesn't rasterize your page...it just dumps the text into the print spooler and frees your system up. The spooler dumps it right to the printer, which uses its own built in fonts to thrash out your page at top speed. I'm not sure....AW might be able to print in this same way minus GDOS...but then, that would call for a reboot without a GDOS present :/ So...keeping WW or something similar is worthwhile.

3. MIDI....
I run teaching labs, and a personal studio around my Falcon, STacy, and Mega ST. There is also an Amiga 2000 and Windows XP box in the collection. I drive several consumer grade GM keyboards, along with a nice collection of 2nd and 3rd generation synths/samplers. Software included in the setup ranges from CueBase Audio, to KCS, to Notator SL for sequencing. Zero X and Sample C serve the sampling end of things. I also have an SMP 24, MIDIX3, and Unitor2. An Anatek MIDI patchbay that was designed for the Macintosh, just happens to work with the Falcon (possibly the Mega STe and TT) as well (via both the MIDI ports and LAN [Apple Talk] port). So, as you can imagine, I have enough MIDI channels at my disposal to do QUITE ALOT with! There are also some not so good analogue multi trackers in my setup...primarily to teach the fundamentals of synching a computer with tape or video. Of course...the standard mixing consoles, amps, monitors, FX units, yadda yadda....

Now, here's why I bother to keep this old stuff around my teaching lab...
Sure, there are modern PCs and Macs that can accomplish the task of all this

stuff combined, on one desktop. The problem with that, is when you are teaching today's generation of teens, it's pretty difficult to illustrate to them what is happening in their creative process with most of the modern software suites. While the modern stuff is arguably a godsend from the creative standpoint where time is concerned....it is very lacking in the engineering and creativity on the micro-level aspect of studio music. With modern utilities, the students tend to cludge through the software using prefab modules or wizards and treat it like a 'pallet' of cool stuff they can combine to make bigger 'cool' compositions, but they never really get into mixing their own paint! In the end, you have a class of 15 people, with compositions that all sound alike because they use the same built in pallet of sounds and effects, while never really delving into these details. Frankly, there's alot of modules in the 'modern software' that make no sense at all from an acoustical engineer's perspective! When they do make sense...it's on the level of a PHD physicist rather than a beginner.

With the old kit...things are in clearly visible modules, boxes, with traceable wires and user interfaces that give instant percieveable user feedback. The students begin to get an understanding very quickly of how their instruments are built, their function, and what it can do with sound. They soon begin to mix their own sonic pallets, and understand exactly what is happening to their sound from start to finish. When you put your hand on a bass module, and say "This is the bass module. The sequencer talks to it over this wire, using channel 3, and this cable can carry 16 independent channels total." the student almost instantly understands the connection. With analog effects, it's even more helpful! What happens if I hook this guitar into this reverb unit, and then this chorus unit, then into my mixer? What if I change the order? What if I hook them parallel rather than serial? What does it mean to 'sync' different tracks or machines? What is an ocillator? What happens when I hook an ocillator to a filter, then to a frequency modulator, then to an amp? Why and how would I 'gate' accoustic drums, and when might this gated concept apply on my digital drum machine?

In the teaching lab...having everything in real life modules, using real life wires, helps a great deal in communicating to the students the various stages their music goes through, while also teaching them the universal vocabulary used by studio engineers to communicate about these ideas. These are things you just don't get from most modern all digital software suites on a single desk top environments.

See, your state of the art software has all of these 'modules' and more embedded in the form of 'code'. All of the old 'analogue' ideas still apply...they're just emulated within the digital domain. "Reverb" generally sounds the same today, with digital technology as it did 300 years ago in a mighty concert hall. Vocabulary...illustration...experimentation...It is my opinion that they'll have a very hard time grasping the mathamatics and concepts of today's tools if they don't have a clue as to what they are emulating from the real world to begin with.
Sometimes a trip to a very old museum really helps today make a LOT MORE SENSE.

Another interesting benifit....
While a modern Mac or PC gets cheaper every day....you can still expect to shell

out at least $400 for even a basic suite of music making software...of any foundation (MIDI, MOD, D2D, etc...) Many of my students simply can't afford to piddle with the latest generation of tools. On the flipside...they can watch Ebay, and for the price of just a PeeCee or Mac with the OS alone...they can find a loaded ST with a Pro Sequencer and a consumer line keyboard or sound module and begin making compositions in their spare time. Also, there's more and more ST MIDI apps hitting the totally free and legal scene as years roll by.

I well remember when I was 16ish, and ALL this stuff was brand new...and only well funded Universities or musicians in debt to their eyeballs had access to these kinds of tools. There was no such thing as a second hand market. Only now...at 33 years old can I nickle and dime my way into these kinds of toys for personal enjoyment without over extending my rather small toy budget. My students, at very young ages, can afford to drive right in...at ages when learning is fast, and ideas flows like water, and before they are so busy with the demands of 'adult life' that so often suck the time and energy out of aspring young musicians and sound engineers.

....
What I find myself using the Atari less and less for these days is Internet access, and true multimedia sessions. That's where my low end PC gets its use, and that's about all I use it for. WebBrowsing, Email, NewsGroups, MP3, an occasional game, file archives and backups, web-cam, access to new cheap hardware (USB), printing sessions, Atari/Amiga emulation, and Movies, etc. Windows is bascially just a bloated browser to me....quite cheap, and usually comes with the hardware. Sometimes I start to buy some software for the Windows Box...and I baulk at the price when I can already do that on my Atari!

> Also, Aren't there any Atari groups devoted to different areas of the
> Falcon or other Ataris
> for Graphics/Video/Animation and Music, MIDI, Sampling also
> programing, and DTP, WP and etc.???

Yes, and no.
There are indeed forums still scattered about for various specific Atari topics. As for actual news groups on usenet....
There's only a hand full left...most with a very broad heading...like this one (comp.sys.atari.st). You may find repeats of these 'general' groups in various languages.
Feel free to post pretty much anything 16/32 bit Atari related here. There's not so much traffic that anyone will complain.

There is a MiNT mailing list that's pretty active.

There is a web site and forum (list serve I believe?) for Notator and Logic.

CueBase has a news group...it's for all platforms, and while you don't see many Atari related posts...I've found that putting them there tends to generate plenty of useful tips and information...as many of the users there had Ataris at one time, or still do.

There is a very good Yahoo forum dedicated to MIDI called 'Tim's Atari MIDI World', which includes a download area with just about everything Atari/MIDI

that's legal to distrubute free.

A couple of the UK music magazines still have active Forums for Atari related issues. I forget which ones right off hand, but I know they're still around and generating a few threads from time to time.

Many of the popular emulators and virtual machines offer forums and or mailing lists for up to date chatter about their projects, and user support.

Most everything that has been ported, or that you wish to port yourself from Unix to the Atari has at least one news group or forum! Some examples are Povray, Tinyfugue, Samba, Pine, and the list goes on and on and on! By far and large...these softwares are considered to be platform independent, so as an 'end user' what applies to a Linux PC shouldn't be much, if any different from a BSD PPC, a MiNT Falcon, etc. The key to these type of discussions is mentioning which version you were able to compile and get running. From there...the software 'use' is relatively platform independent.

> If not I wonder if there are enough Atari Users left to create some
> specific Groups with these types
> of interests?

By all means, go for it.
Yahoo and many other similar outfits offer totally free forum space!
If you have an idea...set it up, and eventually you just might get alot of hits :)

As for getting news groups started...I'm not sure what the current rules are. There are different types of news group listings, with different requirements. I.E. An alt newsgroup might be easier to get, but it's also going to get a ton more spam, and might not be archived. I'm assuming to get one started, you have to file petitions and whatnot. Honestly I don't know...you'll have to research this further if you'd really like to know.

I'm out of time for today...so sorry I didn't include acutal links to the things mentioned before. A good websearch will put you on to most of them. Also, maybe others will post the links and add some if they know them off hand :)

Brian

You know, speaking of this, is there any pages or anything anywhere which explains the different TTram board options available and what maximum capacities and jumper sizes they have? I have a slew of 72 pin EDO ram that I'd like to use on my TT, if I can use 4 32's in the board instead of 4 2's I'd like to do that ;-) Both the boards in my machines are Atari made boards I believe.

>5.13 onwards. If you are using an older version, either obtain an
>update or deactivate this checkbox.

Nope, it's MGCOPY.PRG that is using those threads, not Jinnee.
Whenever the user calls up the copy routine Jinnee by default uses
MGCOPY.PRG if magxdesk is present.

Cheers from Belgium
Dennis

TT monitor can use any ordinary VGA monitor for TT medium (640x480x16
cols) or the TTM195 for some absurdly high resolution mono display. It is
in the original case. It just never used to be. If I did sell it to you,
I would repair it to proper working order and clean it to look as new as
possible, but I'm not going spend my time on this unless I know someone
wants it ;-)

3220. STFM RAM expansion

Newsgroup: comp.sys.atari.st
Date: 2004-05-14 20:38:14 UTC
From: Graeme Roberts <graeme.roberts@btinternet.com>
Message-ID: <c83anm$5gs$1@hercules.btinternet.com>
Source record: 18762

Recently got some spare components to replace my expired 520STFM. Included in this batch was a 30pin SIMM memory expansion kit, but with no documentation; I believe it was made by ATRAM. I had a similar memory upgrade expansion kit from them on my original machine, but restricted to 512k to give a total of 1Mb. I'm sure I've plugged everything into the right places (piggy back adapters on the MMU and SHIFTER chips). The question is how much RAM can I load onto this thing. I've only got 1Mb SIMMs to try (3 chip variety), and at present none work or just give me a black screen. Do I need special SIMM's or maybe 9 chip sticks in order for the machine to recognise them?

Any help appreciated.

Graeme

Hi Pierre

Unfortunately I'm still having problems with getting it to work, this is what I filled in:
Account= FreeServe Mailbox
Hostname = smtp.freeserve.net
Port=110
Username=adel6.freeserve.co.uk
Password=****my password****

Upon Connecting with STik2, I run Meg and click on Check. Box shows Action: Waiting, Status: OK. The after about 2 mins and a bit of flashing on the modem, the Box shows Action: Authentification Failed, Result: 0 Messages.

And this is with 125 messages in the Mailbox with the *** SPAM *** text string in the Subject line.

What am I doing wrong?

Neil :-(

It sounds like you could have simms which are too big for the thing to cope
with, maybe you could try 2x 256MB simms (I assume the adapter takes 2),
the latter address lines could be floating if you try to fit a larger size.
I dont think ECC types will matter in anycase. I've never seen the board so
dont know much. Though I built my own ;-)

Chris,

Thanks, thats what I was wondering. I can get my hands on a set of 4 x 9 chip 1Mb 30 Pin SIMMS next week which may work. More chips per SIMM = less memory per chip which the ST may be able to handle. If not, I can try the 256k SIMM option in the upgrade.

If all else fails I've always got my original 512k upgrade to fall back on which I know worked fine in my original machine :)

Graeme.

3225. Minimum host for Aranym

Newsgroup: comp.sys.atari.st
Date: 2004-05-14 23:10:57 UTC
From: vdjole@EUnet.yu
Message-ID: <c83jlv$q15$1@news.eunet.yu>
Source record: 18767

Hi;

I may have a need for a Falcon-like "Atari" computer in the near future, so I was thinking of dedicating an older PC for that. I would appreciate it if someone could tell me:

1) What should be the minimum capabilities of the host computer for Aranym (CPU type & speed, RAM, disk space) in order that a linux variant of Aranym can run with a speed similar to that of a standard "real" Falcon? (The idea is that the machine would be used exclusively for running Aranym, and boot (almost) straight into it, as much as practical).

2) Can Mint run with memory protection on Aranym?

thanx in advance;

1) Aranym team suggest minimum 486. You should Aranym under linux, if you want all the features. Base your PC on what do you need to get a fairly quick X server running. I would say PII 400 min with 128Mb ram. Hard disk space is not that much an issue, you can install a linux/X system in less than 500mb and also I know of one functional linux/X thats about 50mb. You can download AFROS live CD and boot straight into that, I havent tried it yet so I dont know how easy that would be to install on a hard disk.

2) No idea. Check the aranym pages at http://aranym.sourceforge.net/

Coda.

3228. vnc for atari

Newsgroup: comp.sys.atari.st
Date: 2004-05-15 15:45:41 UTC
From: beebee <beebee@noos.fr>
Message-ID: <pan.2004.05.15.15.45.41.8523@noos.fr>
Source record: 18770

hi!

Maybe tight vnc a free implementation of vnc
is a good choice too!
Another possibility is the use of ssh for
remote screen on slave and run application
only remotely:)
On the master, the application don't open
another screen, so the application is oblige to
have the rï¿œsolution of the host:)
Maybe it is possible to use that with aranym
because there is ethernet implementation:)

I hope you will do that, a dream:)

Bye

3229. Disk image questions...

Hi Guys,

The Atari ST has been my main hobby for the last 3 or 4 years...and I always had many doubts about the Disk Image formats (MSA, ST) and all those compilations... Ill go one by one:

1. The games compilations (Pompey Pirates, DBUG, etc) were made during the Atari-era years? are they supposed to work on a real Atari?

2. If so, why they made almost all the MSA files bigger than 770k?

3. Is there any way to write a 800k image file on a DD disk so I could load it on my Atari?

4. Is there any compilation in .ST format which files are not bigger than 770?

Im using MSA2DISK under MagicMac to generate my "real" disks from MSA files...

Thanks for all!!!

Rod.

They were almost all made during the ST era, yes. They ALL work on real
STs.
>
> 2. If so, why they made almost all the MSA files bigger than 770k?

That is because they made them as big as they could make them and still fit
on a DSDD disk. The disk actually will be over formatted to hold that much
data! I have seen some close to 900k.

> 3. Is there any way to write a 800k image file on a DD disk so I could
> load it on my Atari?

Yes with tools on a real ST or a PC. MSA-II on the ST will write any MSA
file to a real disk. But you have to transfer the MSA file to the ST
somehow. I use my Falcon030 and zip the MSA file on a PC 1.44 disk and then
unzip it to my Falcon HD, then run MSA-II. Works great.

On the PC you can use tools like MakeDisk or ST2DISK, but you need to be in
true DOS mode for it to work with larger disk images, as the DOS emulation
in Win 2k/XP will not allow overformatting to disks very well.

> 4. Is there any compilation in .ST format which files are not bigger
> than 770?

Yes SSDD disk images will be smaller in size.

> Im using MSA2DISK under MagicMac to generate my "real" disks from MSA
> files...

Cool.

Let me know if you need any more help.

From: Tom McEwan <captaininsanity@ONAYAMSPAYuk2.co.uk>
Message-ID: <c86038$71q$1@news7.svr.pol.co.uk>
Source record: 18774

Hi,

Just found a forum thread via google, from about six months back, where a bunch of people were trying to get scummVM working on Falcons, TTs and even STEs. Has anyone here heard about it, and if so, did anything ever come of it? It would be interesting if it were actually possible to get it working on my STE. Unlikely, I know, but I just wondered if anyone managed it.

Thanks.

Tom

you can save images to a floppy on a PC, i know it can be done, though what
lets it down most of the time are the cheap PC floppy drives which dont
often allow anything but the true classic floppy formats.

You cannot transfer a larger than 720K MSA image to a floppy disk on a PC
running Windows NT/2000 or XP. You have to boot into DOS from a boot disk
and run it from there to get it to work. I have verified this problem with
several people and this seems to be the case. BUT If you have Windows 95,
98 or Me it will work! But not on Windows NT +.

Tim

3234. NEWSie, end of

Newsgroup: comp.sys.atari.st

Hi, all!

Sorry to admit it, but NEWsie has just proved itself to be "crap",
as a certain person has consistenly described it, despite my consistent
support of it. I have done nothing to my system to alter it, yet:

I can now receive and send to my chosen NGs, but I can only *send
email*; it is impossible to *receive* email. Instead, I get two
bombs and the error message: "Program returned 6800 exception (error
#-69) [Cancel]".

Nothing I do -- with UVK, D.Edge, Optimizer -- makes a difference. I have
also re-installed Newsie and all my AUTO apps too, with no effect.

1) I am at my wit's end: help, please.

2) What's the latest NG/Email app available (What's that about CAP?).

Thanks,
Charles.

Yup, I do that too. Perfect Emulator. But games like No Second Prize and
Elite are so much better on TT or Falcon/CT2. But I am more interested
in Demo's etc that use the TT's hardware. Not just fast ST stuff.

Mark

Does this Newsie crash happen when you're opening your inbasket, or when
Newsie is downloading from your mail server?

> 1) I am at my wit's end: help, please.

If it's during the mail exchange then use something like Popwatch to grab
your mail?

> 2) What's the latest NG/Email app available (What's that about CAP?).

Amail and Okami are both capable AFAIK, but I personally preferred the
IConnect Emailer client.

I have a good number of old current notes, it would cost megabucks to ship all of them, but I think that maybe 2 or 3 might be sent magazine rate for about $5.00. I carried these all the way from Hawaii 6 years ago. Does anyone want some?

There is a problem with Newsie (on some, if not all versions) if there are more than 100 mails in your inbox, so that's worth checking.

Also, have you checked the problem is not with your ISP, by connecting via another computer ?

I've not encountered this problem at all with Newsie, which I use on a partition dedicated to it. In fact I have not encountered problems for many years now, although I use it mostly for newsgroups. I use Okami with popwatch for mail.

BTW, are you using Newsie 0.96 ?

HTH

All the best

Paul

Hallo Charles!

CS>2) What's the latest NG/Email app available (What's that about CAP?).

That's CAT, not CAP. Cat as in the animal that chases the mouse :-)

AFAIK it's the only current application that's capable of handling both large amounts of mail and news, using any of the major stacks. It's available in german and english, including the online help.

CAT's database consists of several files, where each newsgroup goes into an individual set of 4 files (data, index and associated special files). It's got no problems handling groups with tens of thousands of messages. It will _not_ run very good (if at all) on machines with less than 4MB of RAM, and it will be quite slow in handling really big newsgroups lists on normal STs or unaccelerated Falcons, but that's due to the really _big_ amount of data it's got to handle in that case.

CAT is still under development, and it's freeware and open source. So, contributors are always welcome.

It's available from
http://www.dimitri-junker.de/software/cat/cat.html

There are brief (and a little outdated, I'm afraid) install instructions available, too, the direct link being
http://www.dimitri-junker.de/software/cat/Cat_Engl/cat_engl.html. This is the readme file that can also be reached from section
http://www.dimitri-junker.de/software/cat/cat.html#CatAkt.

For further questions, don't hesitate to ask me or any other CAT user :-)

With best regards
Ekkehard

What benefit would AGA provide? Maybe for a Falcon Emulator but nothing like that exists. Maybe you mean Emulator with faster CPU support? Yes a Emulator that runs on a Amiga with a MC68060 @ 66MHz, Cybervision 64 graphics card and 128MB would be nice... Sadly nothing like that exists, the best I think was the Chamelion you mentioned, which I am also after! There was a cracked software only version that I saw years ago that worked really well. Wish I could get a hold of a copy.

I know what to use to read and write CDR and CDRW, and have one, SCSI version. What does one use with an Atari TT030, or an ST, to work with DVD disks?

Would prefer to have make and model number, so I can look for it new or on e-bay, if possible.

Thanks in advance,

Jim

>I know what to use to read and write CDR and CDRW, and have one, SCSI
>version. What does one use with an Atari TT030, or an ST, to work with
>DVD disks?

You need ExtenDOS Gold as a DVD-ROM driver and a SCSI DVD-ROM (which are hard
to find these days) to read DVD-ROMs.

AFAIK its impossible to burn DVDs on ATARIs.

>Would prefer to have make and model number, so I can look for it new or
>on e-bay, if possible.

I have an DVD-ROM in my falcon that works perfectly but unfortunately its an
IDE drive so manufacturer and model number wouldn't help.

Regards,

Frank

Well, maybe he best way is a new one!
with the very last design and firmware from R CZUBA!
I see on ebay a basic falcon with 14 meg ram
for several euros!
And i think it still possible to have CT60
directly from rodolphe:)
rodolphe can design directly your custom falcon!
He never published that all the ct60 are sold:so:-)
Just be enjoy, this good news!
The link for ebay was publish here:)
Just read history!
Then, contact rodolphe:)
I bye mine, last year, it is really the best
card for falcon user,
we just hope now for "supervidel"!
Bye, and just buy it is the best choice;-)

Bye!

The primary reason for looking for a used ct60 is because at the present time, I only have the equivalent of 230.49 euros. A new ct60 is 319.00 (including shipping) euros. It may take me a couple of months to come up with the difference. I don't know if Rodolphe will have any in 2 months.

3264. STacy schematics for repair?

Newsgroup: comp.sys.atari.st
Date: 2004-05-17 21:17:48 UTC
From: x1nd0lent@hotmail.com
Message-ID: <c6fd3837.0405171317.61be953f@posting.google.com>
Source record: 18657

Greetings, all! I recently acquired a STacy from some guy for a modest price, knowing that it had apparently not been running for a while. I felt up for the challenge, and have wanted a STacy for MIDI sequencing since... forever! There was no power adaptor, but I did find a cheep brick for an old Zenith laptop with the exact same ratings and connector as the one Atari shipped with the STacy. Good news, as I was not going to pay $90 or so for a "genuine" antique wall adaptor, for a STacy I expected would not even run!

Connecting the adaptor, the unit behaves a little better than I had hoped: drives spin, LEDs do something, the screen goes on. This suggests that the electronics might be ok. Main issue now seems to be that the screen is loaded with digital garbage, rather than any kind of desktop. It remains static though, not moving like video. I hit "reset", and I get a different screen of noise, etc. I do not have an Atari monitor to try connecting to the port, but I will probably make a VGA adaptor in a few weeks. What I am hoping is that I might just need to repair some cables to the LCD or between boards. One neat thing is that the display is quite bright, which I have been told is typically not the case with STacys.

Lastly, this unit looks like it's probably quite old, I am guessing that it is the first version, which tells me that this thing is going to need more RAM if I am going to run KCS / Omega with any other modules.

If somebody out there can point me to, or send to me, the schematic diagrams to the STacy I would be extremely grateful! Please help me to fix this beautiful old machine so it can help me to make crazy music!

Aaarrgghh!! I am really pissed off. I am a collector of Commodore and Atari computers and have recently been buying mint games in the box from eBay. Almost everyone keeps charging high shipping/handling costs, then putting the boxed game in a padded envelope or covered with brown paper bag and paying $1.60 to send it. If that was not bad enough the game will always arrive flattened out and smashed!!! I have gone as far as emailing the shipper before they mail it to tell them to "Please pack it in a box" or something, and if their shipping cost is not over $5, even offer to pay extra to cover the cost! What should I do about this? I am very tempted to start sending a disclaimer in my emails to them that I will post a negative feedback if item arrives damaged due to neglegent packaging. What do you think?

Tim

I have one that does something similar....
I can't figure out for the life of me what's wrong with it.
First I replaced the Shadow chip.
This helped...but....even with the new chip, I have to crank the 5v side of the internal power supply to over 7 volts, and turn the 12v side down as low as it will go. Doing this, I get a very nice clear display...the catch is that with these voltage settings I can not hook up any of the disk drives...as these voltages will fry them :/ Note, the old Shadow chip displayed some kind of grid pattern and that was it...no matter what the voltage was set.

My best guess is maybe the old internal power supply isn't up to the task anymore. I haven't had much luck finding that PCB as a replacement part (if they have it to offer). I'd love to patch in a better, more modern supply somehow, but I have no idea what the pin-outs are on the STacy.

Fortunately, I found another STacy with sick parts, but different sick parts...between the two, I now have a nice STacy 4 and a couple of spare screens. Hopefully it'll last for a long time yet :)

Brian

hi!

The first point is the reservation!
Maybe he will only wait to have the money
to back to you:)
In any case don't hesitate to explain to him!
If you want, i can write to him too! :-)

Do you already have a falcon?????
For the power it's "atx" and you need the last "hddriver"
to support the speed of the CT60 with ultra dma ide disk:)

Bye!

hi!

Good news DVD:)

It still exist a free "dolby digital surround reader" for sound but only
for falcon!
It's a standalone program that use the internal matrix:)

But do you hnow program for the "pictures"?????
Aniplayer can read DiVX but no DVD!

Hi,

Yes, I already have a Falcon....it's a C-Lab Falcon, I don't think that would pose a problem.

I'm getting HDDriver next month. I have an ATX peecee that went bad, but the psu, 30gig hdd, floppy and such are still good. Will have to look for a case though cause my tower is not a full tower.

And I'll still have to find and buy all the port extenders.

Thanks,

At the moment for me I do not think there is anything. HDDriver
will recognize the DVD-ROM drive from what I have heard, but
programs like Extendos Gold would probably have to be upgraded.

Does your hard drive driver recognize the CD drive? Do you have
the latest version of Extendos Gold? Have you setup Extendos Gold
to read your CD drive as drive P? When I had problems with my CD
drives, I contacted Roger Burrows at Anodnye and he had me up and
running in about 2 weeks. I would go that route if you cannot
solve it on your own.

The only real problem with Newsie is that it was never upgraded
like it should have been. It always locked up my Hades and I was
at my wits end, so I installed Okami and have I never been
happier. It takes a while to set up, but after that, it is a
jewel to use. I would go that route. I use aFTP for ftp sites and
MyMail for email, but you still can use Okami for email if you
want to.

hi!

I'm agree with that, for exemple you can find
dvd with iso file ready for cdrw:)
For instance, you can read DiVX, MP2 on cd with aniplayer and falcon!
aranym, magicC too:)
It still exist possibility to listen dolby surround audio!
on falcon!
For compatibility, maybe itisn't a dream to use stream software
like vidï¿œolan, it is use ethernet 10bT for lan!
http://www.videolan.org

bye

Oops!

I forget something very important!
If now, we can read DVD, it 's mean that we can read
"udf" file too:)
So we can use cdrw just like any hd:)
In this case, the session of cdr can stay open:)
For backup and ..... it is great!

Bye:)

there is not much extra holes.. i drilled 1cm high (as high as connectors on back side) and full length wide (from 1st to last connector) hole, so falcon mobo covers all that on back side.. dont look bad at all. And for romport u just make hole where 2 midi connectors are. I didn't make any hole for MIDI tho... And yes it looks cool.

Good going!

My STacy does not display a grid, it looks more like an old-school 8-bit fractal or something.

This is exactly why I need schematics... if the power supplies degrade over time- one would need to know what the optimal supply >should< provide, rather than just measuring a faulty one. Power supplies for the most part very easy to make. Maybe I can discern from the power conditioning board itself? The AC-to-DC brick works perfectly, I connected a meter to that as soon as it had arrived.

I can barely figure out how to open the case to my STacy, no less repair it! I know I am being overly cautious though, so I don't damage anything further, like plastic tabs or fixtures. I will clear the bench off soon and have room to try this in earnest. But I will hopefully find schematics in the meanwhile!

Hallo !

S>And I'll still have to find and buy all the port extenders.

If it's done right, you won't need many of these. Just cut the back of the tower case to fit the connectors of the Falcon motherboard, and mount it such that the connectors are accessible from outside. Then, you've got to extend the keyboard, ROM-Port, Joypad and MIDI-ports only. Most of which I never use, anyway :-)

mit freundlichem Gruï¿½ aus Bubenreuth

I had a problem like that, and it was not Newsie that did it. It was a bit
of unwanted commerical message that did not have a space between address
and data. The solution was to walk to the local library and use their
browser to connect to that ISP's web-mail page, and delete the first
message. Until they changed their web page so that CAB would no longer
read it, I did it from home, with CAB.

Call your ISP, tell them your mail is stuck, and they might have a
solution. And, the solution may involve a different browser. The ISP
involved was Mindspring/Earthlink.

Jim

> anything further, like plastic tabs or fixtures. I will clear the
> bench off soon and have room to try this in earnest. But I will
> hopefully find schematics in the meanwhile!

The trick to getting inside...
Pop the screen up (as if you're about to use the STacy). Peel off the STacy lable.
Take out the two screws that are behind that lable.
Close the screen back down and carefully take the topmost cover off.
Push all the slack you can in the wiring harness down inside the STacy...
If you find that doesn't give you enough work clearnce to take the STacy apart, unhook
the harness from the screenand feed more slack...or even feed the harness all the way through (the connectors will fit through the tube end-way if need be).

When taking the keyboard off....the thin ribbon should slide right out of the slot on the memory/TOS board. Just be sure it's not the 'locking' type ribbon slot before you pull. One of my STacys had the lock type, the other did not.

Finally pull the RF shield and you're in buissness.

If you learn anything useful, please let us know?
If you build or repair the internal power supply, maybe you'd consider building me one while you're at it? Of course at a price :)

Thanks,
Brian

See Jim's reply and mine later in this thread.

You could also try generating a false email (or copying one from another
folder) into Newsie's inbasket to make sure that it can read that, just to
prove where the problem lies. My money is on a duff email on your server
though.

Interesting - I too had a problem with an email that crashed Emailer as soon
as it tried to import it. The solution in this case was to delete the
offending message from Emailer's incoming mail folder (where they're stored
as they come in) and then re-import the remainder.

Charles could try Telnetting into his email server, using its name (eg
pop3.hisserver.co.uk) and port number 110 as arguments. He will also need
his login and password - then it should be possible to list and delete the
offending email from the server if the problem is as you've described.

> hi! too:)

>>There is new hardware (CT60, Eiffel, EtherNEC, perhaps SuperVidel) and at
>>the software side there is a lot of development from people worldwide
>
> The CT60 and SuperVidel are Falcon only,

yes it's better than nothing:-0)

when will Falcon users ever
> realise that the Atari platform is not equal to the Falcon?

Yes and and no!
The motivation is the only way:)
(aranym have intï¿œgration of virtual xtos for virtual dsp too)

Oliver kotchi last year do a real big job with the dï¿œesse:)
The dï¿œesse card is a dsp pci card for eclipse falcon, hadï¿œs, and
milan:) The few first productions was sold with all the tools for develop
news software!
In fact, it's no future!?????:-((((to bad

Why, because maybe of oldfashion atari users who doen't want ï¿œvolution?
Yes, it is a real question?
It was very hard to sold milan computer:
(a real atari cliï¿œne without dsp....)
It's very hard to sold CT60 too!
(it was a such great job, it a magic job from rodolphe and didier
and others who don't give names)

and it still exist aranym for big computer
and great emulator for palm os, and win ce!

So today atari&os is present on virtually on all
computer of today with ï¿œvolutions for software:)

But for a real new hard computer, i don't hnow!
Maybe, you have one choice, ideas....?????

As for the
> Eiffel and EtherNEC these are new, but it's not like we didn't have other
> options before these came along.

Yes and no again:)

The difference, it's the open source of project!
With eiffel, you can decide D.I.Y
(do it yourself ;) or bye a real plug and play system:)
For virtualy any ps/2 mouse (wheel......)
for virtualy any heyboard, langage, option, windows keyboard, radio ....)

For etherNEC too, you can D.I.Y and around there is compatibility
for sting, mintnet, CT60.....
And evolution, with samba, yes......

Maybe, if you want to be the troll, who win:)

bye:)

>Nobody said that it is unusable, but to claim that it is close to
>replacing CAB is nonsense.

For me, it is not. As a simple web browser Highwire already replaced CAB. As a tool for downloading, watching little animations (with Aniplayer/OLGA) or entering SSL-sites I am still using CAB.

>At this very moment it's not even possible to save or print

I never printed anything since years. I completely live the dream of having a paperless office. :-)

>a webpage, call me crazy, but this are basic features.... there's no
>hotlist and there's no option to set a home page, the contents of the cache
>can be viewed and deleted completely but there's no option for the user to
>edit it.

Of course there are features missing like background pictures, ssl, cookies (I completely disabled them in CAB) etc. but for a version 0.1.7 it is quite evolved.

It already displays more pages than cab, it doesn't crash that often like cab does, it is faster, it is free, it is still developed, it supports Unicode and there is support for it. For me these are enough reasons to use it as my standard web browser.

>There's no support for TrueType fonts yet,

That is wrong. I can use TrueType fonts. At the moment there is no front end for that, but it is possible with "Fontlist".

>the icon bar can not be moved by
>the user or even hided, OLGA and DHST support ? cookie management?
>etc...

See above.

>of the CAB modules wouldn't be a bad idea either. I think that it'll
>take the HIghwire project team at least another couple of years.

Of course it will take I while but I believe that their progress is noticable. :-)

>BTW: I've been googling for years with CAB, Google is my home page.

I don't think so because in the past there have been some faults when using Google with CAB, they just recently changed something so you now can google with CAB.

Real popcorn (without salt and butter) is a great packing material and is biodegradable. Not sure if its cheaper then foam peanuts or not and it might fall apart enough to get inside anything that's not bagged.

>I'm not pessimistic at all, I was stating the cold hard facts. I don't
>know where you were hiding at the end of the last century, but it was

I still know where I have been at that time. Do you know? :-)

>to see what the word "progress" stands for. In 1999 more stuff was

I just browsed their archive and in 1999 there was nothing really special I would remember. In 1999 we even couldn't listen to MP3 files on ATARIs (well, Falcon, Milan and Emulators to be exactly).

>still some alive and kicking back then) could sell you a Milan straight
>from stock.

The Milan was still born, sorry. It's a good computer but it had very little support by Milan GmbH. :-(
Especially how they left the market. :-(((

>The CT60 and SuperVidel are Falcon only, when will Falcon users ever
>realise that the Atari platform is not equal to the Falcon?

Oh my god. Who prevents you from using Papyrus X!, ExtenDOS Gold/CD Writer, Tempus Word, Porthos, Apache or Samba (just to name a few) on your TT?

Of course there are new Falcon only programs but what's the problem?

>As for the Eiffel and EtherNEC these are new, but it's not like we
>didn't have other options before these came along. In Germany Peter Denk
>Gmhb can sell you a PS2 Mouse and keyboard adaptor,

Of course he can but unfortunately it doesn't support mouse wheels. :-(

>remember. In the TT I have a 11 years old Riebl card, in the clone a
>modern ethernet card....

But these solutions are not available any more. Apart from that can you use a VME networking card only in a TT or MSTE. When will TT users ever realise that the ATARI platform is not equal to the TT? :->

>But this is a bit like the chicken and egg dilemma, in order to read
>them I must be able to burn them first...

Well. I have a lot of DVDs and I didn't burn any of them. You can simple go to a shop and buy some. :-)

>>Papyrus X! was even released for our small platform,
>Sure, and ain't it just great?

Of course it is. :-)

>>everyone has noticed ACE Tracker etc. etc.
>You mean musical minded Falcon users?

Well, them too. :-)

I think you may well be right about the cause of the problem (I hope so
as it is by far the easiest for Charles to deal with) but as he is with
Zetnet, (an excellent UK ISP :-))) all he needs to do is telephone their
Tech support and they will simply delete the offending mail for him.
They did this for me a few years ago.

To give you some idea of the quality of service Zetnet offers, I had one of
the directors phone me (on my mobile) one evening to help make sure my
ADSL connection was working again after a problem. The same director
regularly posts to 2 or 3 Zetnet support Newsgroups, as well as mailing
customers individually if more help is needed.

They also continue to help customers with Atari, and other non PC
platforms.

Cheers

Paul

All your replies confirm that it is not NEWsie at fault. After removing
every app except those that apply to the internet, I still got the crash
and error message.

I have contacted the ISP Zetnet and await their reply: they are usually
cooperative.

Will report success (or not) when available. However, will also explore
"CAT" as well.

Many thanks to you all,
Charles.

Are you sure ? You can use games, linux, or Gfa basic for example with
olds keyboards interfaces ? 99 % of IKBD commands are supported inside
Eiffel. Unused commands are supported. And you can put a thermal sensor,
a fan, a PS/2 mouse/keyboard and 2 atari joysticks. The set 2 of AT
keyboards works, there are lot of new features with new keys, for
example the Power key.

In the mean while Okami has been improved. The installation is still a
little bit problematic but not so difficult anymore as it was before.

A month ago I tried to install CAT. Although it comes with a
installation program I found it very, very hard to get CAT running. As
today I'm still unable to work with CAT. For some reason I can't let CAT
list the available newsgroups, ergo I can't retrieve for instance this
newsgroup.

New Gadget Forum.

www.GadgetForum.net

Hey fellow gadgeteers, let's talk about gadgets and stuff.

Who doesn't love gadgets? Gadgets make unique and thoughtful presents, and have a very high cool factor. No matter how up-to-date you are with gadgets, there's always something newer, shinier, better and faster.

We rely heavily on electronic gadgets and gizmos. Without these electronic gadgets we would be lost.

Ladies and gentlemen, I have launched a new gadget forum ï¿½ how cool is that. My aim is to make this the best gadget forum on the planet. (Now stop laughing) I am not joking my friends!

I have searched on the internet for a decent gadget forum but couldn't find one. Drop by and say hello and meet other gadgeteers. I want you all to sign up and start posting. Tell your family and friends about it.

Source record: 18613

YES, the boards are here and the CPU too !!
Shipping will begin friday 21st May !
I will chip in the following oder :
- CT60 WITH motherboards here (soldering fitting) : no more place here ;-) .
- Developers CT60
- Users

All three categories in the order I received money.

DON'T ask me about if the board is sent to you or not !!
You will receive an email if the board is shipped to you !
If no email, this means NO shipping (or bad email address !); please wait !

I have really no time ot answer to people who have no patience...

Thank you

I see no problem with that. As a person that buys stuff from time to time
on Ebay, I
read the feedback to see what to expect. So people get really mad about
negative feedback,
but they deserve it if their shipping methods are sending you damaged goods.
Just
be factual and accurate in your complaint and you are doing a service to
others.

Will give the following stuff away for free (you pay for shipping):

- Daatascan PRO b/W hand-scanner. Connects to the ROM-port of a
Falcon, ST or TT.
- Neodesk 4
- Vidi ST video digitizer.

I also have for sale an Atari TT with 32Mb of TT-RAM and a Crazy Dots II
graphics card. The PSU is a bogded and modified PC AT-PSU, and the case is
a bit yellow with a hole and some cracks in the front. Works really well
though. Make me an offer!

Hallo Martin \"Nightowl\"!

MB>A month ago I tried to install CAT. Although it comes with a
MB>installation program I found it very, very hard to get CAT running.

This _really_ shouldn't happen :-(
Is that still the problem with the hades?

MB>As today I'm still unable to work with CAT. For some reason I can't
MB>let CAT list the available newsgroups, ergo I can't retrieve for
MB>instance this newsgroup.

Did you read and follow the english installation instructions?
What exactly fails, and if in2cat is running, what's in the in2cat logfile?
This should give us some clues about what's wrong.
Also, the contents of infile.txt might be interesting.
As a related issue: are the MausTausch.Commands available?

If everything else fails, you could still retrieve this group by manually
adding two files:

$cat/database/I2C_GRUP.INF:
#YGB
+comp.sys.atari.st 15000

The number is the last message that's been retrieved. Cat can import large
chunks of messages, but there might be a little problem with the sort order if
there come more than 1000 messages at once.

$cat/database/YGB.TXT:
+comp.sys.atari.st 15000

Mostly the same information as in i2c_grup.inf. Anyway, with both of these
present, in2cat should connect the news server and try to retrieve messages
from this group.

With best regards
Ekkehard

Ok, thanks for the walk-through, Brian. I found the secret screws and was able to get the case open. How did they ever fit this thing together with such short LCD wires?!

I see what was going on in there... next to a two-pin connector (J15) there were two parts, probably a resistor and capacitor, which were completely burned. It seems like replacing these would only help if I was going to use J15, but I have no info on it. Two pins... maybe a speaker output? Anyway, those two parts were the first things after the large diode where the DC power was suppsed to connect. Either something nasty was connected to J15, or (more likely) somebody tried a bad choice of adaptor to run their STacy off of! This unit's suffering could have been spared with a simple fuse. Fortunatel, since this 16-bit computer uses a PCB with only two sides, it being burned most the way through is not going to hurt anything.

But obviously something on my board is fried. Checking the output again for the first time in a while, it is blue and white blocks. Not bars accross the screen, but various block "patterns".

I guess I will start by measuring the outputs of the voltage conditioning board. Just a bunch of simple voltage regulators for the most part, and LCD inverter. Suppose I should make a VGA adaptor also so I can check for video output.

What does the "Shadow" chip do? I guess that is the C11775-001 ic which I could find no information about.

Since I have no schematics, could somebody tell me which other ST the STacy is most similar to? I guess I could sacrifice an old ST for ICs and just start replacing chips in there. I have little way of knowing which chips are functioning normally. Only tricky one to find appears to be that Shadow chip. If it was only used in STacy and STbook.... I guess it might be an LCD thing. Still, I'd prefer to ascertain that the rest of the computer is ok before I'd shell out money on a replacement Shadow chip, as I can't afford one now. I don't know what to do next, but at least I can begin to strategize.

3326. Where to find Cambridge LISP for ST?

Newsgroup: comp.sys.atari.st

Having been interested in the software "Symbolic Composer" for some years, but unable to swing it's price, I was delighted to see that the Atari version has been made available for download. I noticed from reading the documentation, that the app was coded in Cambridge LISP, which interests me anyway as I have started trying to learn LISP on my mac.

Anyway, all I know about Cambridge LISP is that it was put out by a company called "Metacomco", which seems to no longer exist. I found a few review articles from years ago. Anybody know more about this, or where I can get it from?

Metrophage

My understanding is that's that chip that drives the LCD display.
I forgot to mention that on the duff STacy I mentioned earlier, the ST type monitor port works just fine (at least in monochrome...have no color to test it with).

ATY and Best both seem to have a really good supply of spare chips. Some pulled, some brand new. That is where I found mine. I'm pretty sure I remember that both dealers test before shipping. Wiztronics is always very good about testing anything they sell before it ships as well.

Brian

Most likely the case, though the proper PSU is around 18V IIRC (I have one
in the other room I can check) and there isnt much around, consumer PSU
wise, that would fry that. I do hope no-one was stupid enough to directly
connect it to the mains...

> But obviously something on my board is fried. Checking the output
> again for the first time in a while, it is blue and white blocks. Not

Could be that the shifter is dead. Does the stacey do anything else, like if
you put a disk with something on it in the auto folder, can you hear it
booting from the floppy?

> I guess I will start by measuring the outputs of the voltage
> conditioning board. Just a bunch of simple voltage regulators for the
> most part, and LCD inverter. Suppose I should make a VGA adaptor also

Dont touch the inverter, you probably know anyway but just in case you dont,
they are high voltage.

> What does the "Shadow" chip do? I guess that is the C11775-001 ic

> and just start replacing chips in there. I have little way of knowing

I Believe it would be the later revision1040STFM just before the 1040STE came out. Most ST's are much the same but the main differences between them seem to be that some parts that are the same are in a different package on a different mobo. I cant remember any specific examples. Maybe the GLUE is the most revised chip? Some boards have TOS in 6 eproms, some in 2. I havent opened my Stacey to find out (Its a working machine, I want to keep it that way).

> which chips are functioning normally. Only tricky one to find appears

Hopefully when youve repaired the board traces and replaced the burned out components it may work ok. Well you can hope.

Coda.

I used to do the development on PII@400MHz+128MB SDRAM and it was still
faster than my F030w/FX@20MHz. You can fit aranym to say 40MB HDD if you
like, so the minimal harddisk that is in production currenly would
definitely suffice. ;)

> 2) Can Mint run with memory protection on Aranym?

Yes it does. Last time I tried it failed however. But, yes the MMU is
present and if it is not working then it is a bug.

best regards

Hello Atarians,

I've bought a 1 Gb SCSI harddisc for my Mega STe. There are three
connections: 50 pins, 4 pins en 2 pins. The first two are clear, maar the
third isn't.
The original Mega STe harddisc only had one option for those two pins, but
now I have twelve. Or rather 10, because 1 and 6 won't fit for shure.
I've tried some but without results.
I've added a picture:
http://roxxity.b2music.net/images/maga/hdd_1GB.jpg

The numbers are from right to left.
The sticker beneath says:

12...........1
JP
1 Spare (50pin) ID Bit 3
2 ID Bit 2
3 ID bit 1
4 ID Bit 0
5 Disable auto spin
6 SCSI term on
7 Disable unit ATTN
8 TI Sync Nego
9 Auto start delay
10 Delay start 6/12
11 Disable parity
12 Led out

Please help,

Jos
